Prayer Before Class Starts

*We thank you for this new day, Lord.
Help us to embrace all that it may hold for us.
To hear the birdsong, and have new melodies in our hearts.
To see the sunrise and create beauty with our hands.
To touch the leaves that grow afresh,
And allow your love to touch our hearts.
To smell the fragrance of the flowers
And breathe in the wonder of your creation.
To dwell on the beauty of our world,
And study and fathom your miracles.
To enjoy the conversations we have and the lessons we go to,
May we drink in all the goodness you have for us.*

Q. The following are homologous organs except ____.

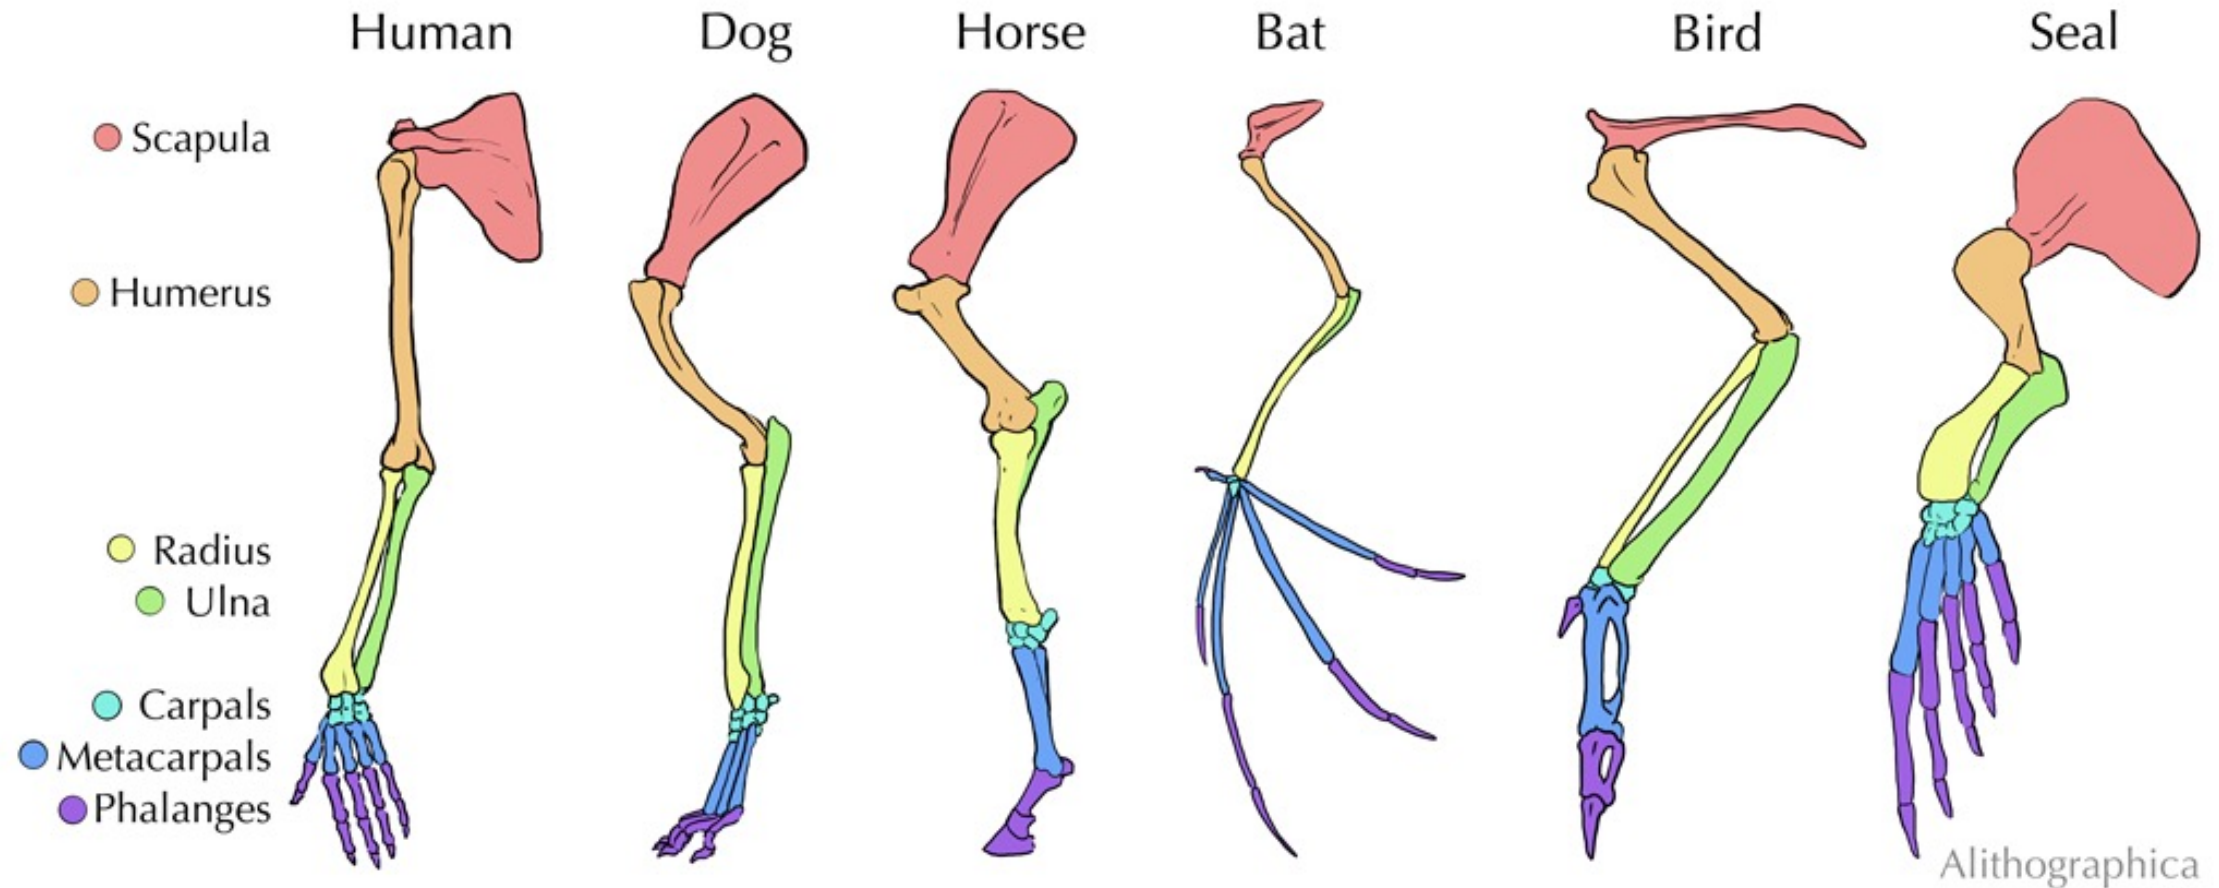

answer choices

- ☐ a. human arm
- ☐ b. bat's wing
- ☐ c. seal's flipper
- ☒ d. baby feet

Homologous Structures

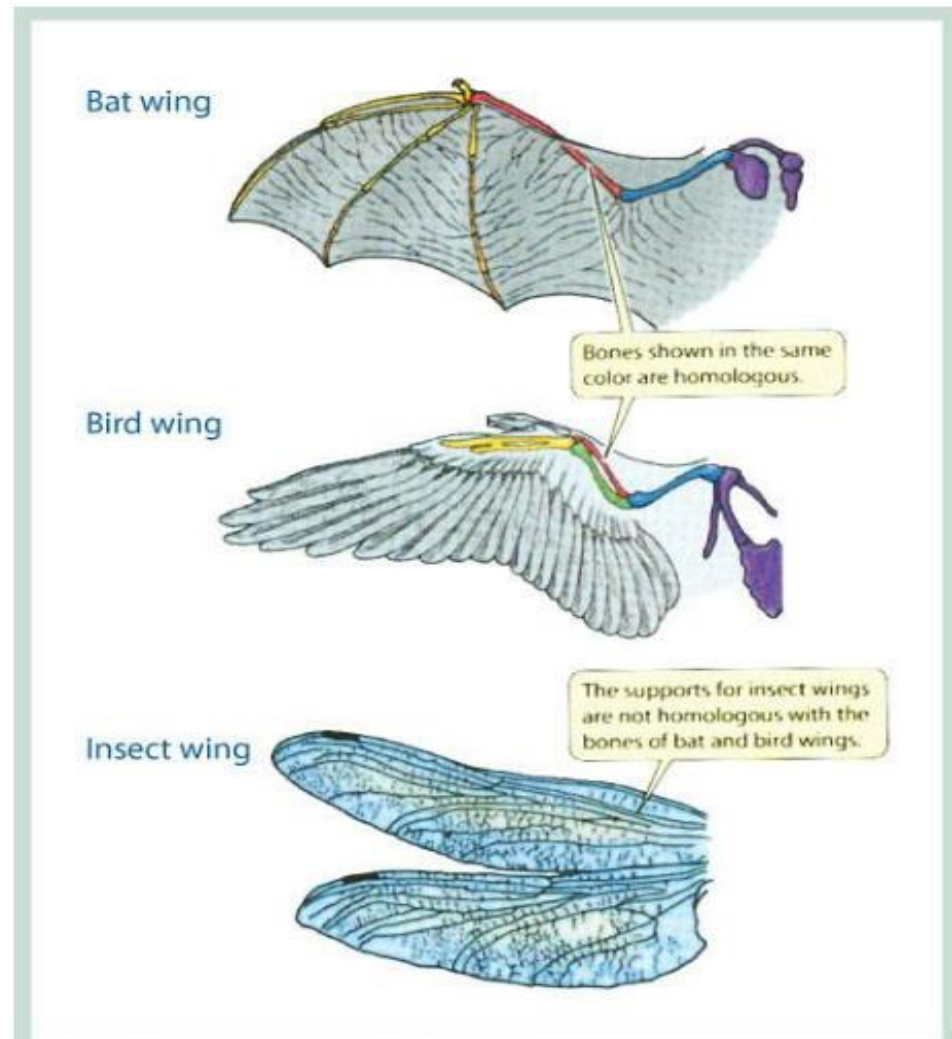

A homologous structure is an organ or bone that is derived from a common evolutionary ancestor. Below are examples of forelimbs in several species that demonstrate reshaping of the same bones.

Not all structures that function similarly are homologous. Bat wings and butterfly wings are both adapted for flight but evolved separately; these structures are analogous. Bat wings and bird wings are homologous as forelimbs but evolved flight adaptations separately. This makes them either analogous or homologous depending on your frame of reference.

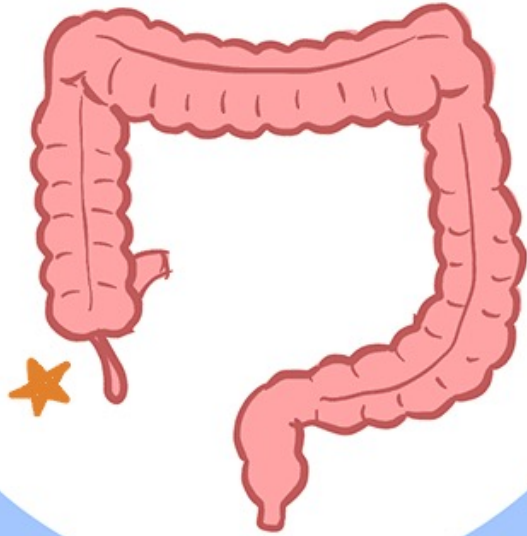

Analogous Structures

- Body parts that have a.....
 - **Similar function, but**
 - **Different structure.**
- Shows evidence of separate evolution, *not* from a common ancestor.
- Example: Bat wing, bird wing, insect wing.

A vestigial structure is an anatomical feature or behavior that no longer seems to have a purpose in the current form of an organism.
