

Child and Adolescent Development

PRINCIPLES OF DEVELOPMENT

Phylogenetic Principle	Ontogenetic Principle
State that development follows an orderly sequence which is predictable and is true to all member of certain race. Predictable trends of development: Cephalocaudal trends- development proceeds from head to foot direction Proximodistal trend- the parts of the body nearest the center are the parts which development earlier.	The rate of development is unique to every individual. It is brought about by one's hereditary as well as environment influences.

STAGE OF DEVELOPMENT

1. Pre-natal Stage	From conception (when the ovum is fertilized by the spermatozoon producing a zygote or fertilized egg) to the time of birth.
2. Infancy or Babyhood (0-2 years old)	Foundation age when basic behaviour patterns are organized and many ontogenetic skills emerge.
3. Early childhood(2-6 years old)	Characterized as pre-gang, exploratory and questioning age. Language and elementary reasoning are acquired and initial socialization experienced.
4. Late childhood (6-12 years old)	Gang age, age of creativity, development of social, self-help, play and school skill.
5. Adolescence(13-19 years old)	Transition age from childhood to adulthood when sex maturation and rapid physical development occurs resulting to change in way of feeling, thinking and acting.
6. Early adulthood (19-40 years old)	Age of adjustment to new patterns of life and new roles such as spouse, parent and bread winner.
7. Middle age(40-retirement)	Transition age when adjust to initial physical and mental decline are experience.
8. Old age (Retirement-death)	Increase rapid physical and mental decline. Psychological as well as physical illnesses are experienced.

THEORIES OF DEVELOPMENT

PSYCHOANALYTIC THEORY (PSYCHOSEXUAL DEVELOPMENT)

Sigmund Freud- **believed that a person's behaviour can be motivated by strong unconscious drive or urges toward self-satisfaction**

1. ORAL STAGE (0-2 years old)	- In this stage, the mouth is the center of pleasure - Failure to satisfy this stage will result later to smoking and other vices
2. ANAL STAGE (2-4 years old)	- The anal region is the center of pleasure - Gains pleasure in the elimination of the bowel: "toilet training "

	- Failure to satisfy this will result to: - Frugality (stinginess) - Greediness - Obstinate or stubborn character - Disorderliness		
3. PHALLIC STAGE (4-6 years old)	"Phallus"- male sex organ (symbol of strength and power) - Derives pleasure from the manipulation of sex organ <table border="1"> <tr> <td>Oedipus Complex: rivalry between the son and the father to get mother's attention.</td><td>Elektra complex: rivalry between the daughter and the mother to get the father's attention.</td></tr> </table>	Oedipus Complex: rivalry between the son and the father to get mother's attention.	Elektra complex: rivalry between the daughter and the mother to get the father's attention.
Oedipus Complex: rivalry between the son and the father to get mother's attention.	Elektra complex: rivalry between the daughter and the mother to get the father's attention.		
4. LATENCY STAGE (6-12 years old)	- Calm stage - Conflicting feelings are confined in the subconscious mind - Energies are diverted to school and peer activities		
5. GENITAL STAGE (12 years old)	- Start with the onset of puberty - The individual is now attracted to the opposite sex.		

SOCIAL DEVELOPMENTAL THEORY

Lev Vygotsky- **believed that this life long process of development was dependent on social interaction and that social learning actually leads to cognitive development.**

- Cognitive development and language are shaped by a person's interacting with other's
- Children's knowledge, value, and attitude develop through interaction with other.
- Social interactions that assists in learning increase a child's level of thinking.
- Student will learn best through activity.
- Student should be encouraged to communicate frequency with self and with teacher.

PSYCHOSOCIAL THORY

Erik Erikson- **Each of these stages has a specific psychosocial crisis that affects the development of the child.**

1. TRUST vs. MISTRUST (0-18 months)	- To develop a basic trust in the mothering figure and generation it to others. - The child trusts those who care for her and mistrusts a stranger HOPE
2. AUTONOMY vs. SHAME and DOUBT (18 months 3 years old)	- To gain some self-control and independence within the environment. - Learns to walk and use his hand - If encouraged, develop autonomy - If discourage and punished harshly and excessively the child develop dependence and shame, doubt and self-pity. WILL
3. INITIATIVE vs. GUILT (3-6 years old)	- To develop a sense of purpose and the ability to initiate and direct one's own activities. - Begins to explore his social and physical world, discovering what he can accomplish aware of various social roles initiates adult's behaviour - When punished develops sense of guilt.

	• The family is responsible for the child's behaviour and action • PURPOSE
4. INDUSTRY vs. INFERIORITY (6-12 years old)	• To achieve a sense of self-confidence. • Child's world broadens • Technical skills are learned • Peer group influence • Identification and/or separation with sexes • Play age • When the child cannot accomplish the expectation from him, he develops a sense of inferiority • COMPETENCE
5. IDENTITY vs. ROLE CONFUSION (12-18 years old)	• To integrate the tasks mastered in the previous stages into a secure sense of self. • Always asking Who am I? • Struggles with society's demands and physical changes in his body • Peer group becomes an essential source of rules of behaviour • FIDELITY
6. INTIMACY vs. ISOLATION (18-24 years old)	• To form an intense, lasting relationship or a commitment to another person, a cause, an institution, or a creative effort. • Develops warm intimate relation with another person and failure to develop such relationship results in isolation. • LOVE
7. GENERATIVITY vs. STAGNATION (24-54 years old)	• To achieve the life goals established for oneself while considering the welfare of future generations. • The most productive years of adulthood • The individual's worth is dependent on his contribution to family and society. • SELFLESSNESS
8. EGO INTEGRITY vs. DESPAIR (54 to death)	• To review one's life and derive meaning from both positive and negative events, while achieving a positive sense of self. • The individual comes to the temporal limits of his life. • The period to achieve one's goals results in regret and despair. • Fear of the end of life. • WISDOM
COGNITIVE DEVELOPMENT THEORY (INTELLECTUAL DEVELOPMENT) Jean Piaget- believed that a child enters the world lacking virtually all the basic cognitive competencies of the adult, and gradually develops these competencies by passing through a series of stages of development.	
Cognitive Development process	Assimilation: absorb as part of itself. The individual acquires information or knowledge by which experiences interaction are into existing schemes.
	Accommodation: A process of creating a new scheme by modifying an existing scheme after an individual's interacting

	with the environment.			
1. SENSORIMOTOR (Birth-2 years)	• Learning is based on sense perception.			
	Primary circular reaction Repeated actions centered on the infant's body Ex: thumb sucking	Intentional behavior Child repeats actions so as to prolong interesting or pleasant events Ex: crying to attract attention	Object permanence Knowledge of the existence of objects in his environment, independent of the child's actions emerges such that the child starts to search for missing objects like toys.	Representation Allows the child to seek necessary manipulate of internal symbols instead of physical objects Ex: trial and error to solve the problem, manipulate of toys.
2. PRE-OPERATIONAL (2-7 years old)	• Emergence of language skills • Interprets experience • Words become symbols for objects • Thinking is egocentric (centered to himself) • Thinking is irreversible (inability to rethink) • Incapable of logical thinking • Elementary schools years • The child begins to learn symbols and concepts, time, space, shape, size, etc. • The child's thinking becomes more logical and systematics			
3. CONCRETE OPERATIONAL (7-11 years old)	Conservation Ability of the child to conceptualize the retention and prevention of the same quality under various transformation Ex: 1 kg wood= 1 kg feather Eight 50 centavo coins = Php4.00		Reversibility Ability of the child to understand the completion of certain operations in reverse order but ending up the same. Ex. Ability to understand that ice and water vapour	
4. FORMAL OPERATIONAL (11-16 years old)	• High school years • Develops logical reasoning skills • Decreased egocentricity			
THEORY OF MORAL DEVELOPMENT Laurence Kohlberg-believed that as children grow they pass through several levels of moral development consisting of different stage which serve as the bases of their behaviour as adults.				

LEVEL ONE(Pre-conventional morality) • Children’s judgement are based on external criteria • Right and wrong are according to standards set	STAGE ONE • Behavior is based on reward and punishment • Wrong behavior result to punishment • Right behaviour results to reward and praises
LEVEL TWO (conventional Morality) • Children’s judgement is based on groups expectations	STAGE TWO • Action are based on self-satisfaction • Helps those who help him
LEVELTHREE(Post- Conventional Morality) • The individual recognizes arbitrariness (absoluteness) of social and legal conventions • The individual develops concept of moral values	STAGE FOUR • What is right what is accepted • Conforms to the rules to avoid disapproval
	STAGE FIVE • Laws are obligatory (Dura lex sed lex) • The conforms of right and wrong is governed by reason
	STAGE SIX • Morality is based on mutual respect • The individual conforms to the rules to avoid self-condemnation.
