PREFACE

The Philippine Normal University, the National Center for Teacher Education, is proud to release its new volume of Licensure Examination for Teachers (LET) Review materials.

As NCTE, PNU is mandated by law to take significant steps that will improve the quality of teacher education in the country. One of these steps is to share its resources and expertise to all teacher education institutions.

Held twice a year, the LET is the government's mechanism to ensure that those who enter the teaching profession satisfy the professional requirements of the job. The Philippine schools need teachers who possess knowledge, technical and pedagogical expertise.

This new set of review materials is PNU's contribution to help the teacher education graduates hurdle the exam successfully. This will facilitate recall of the important concepts in the different subjects/areas taken in their respective undergraduate programs.

PNU hopes that these review materials reach all the prospective teachers in all parts of the country.

Good luck and congratulations in advance!

ESTER B. OGENA
Consultant and President

INTRODUCTION

This book aims to provide supplemental review materials to prepare future teachers for the Licensure Examination for Teachers (LET) given twice each year by the National Teacher's Board of the Professional Regulation Commission (PRC). As review materials, the collection of which this book belongs does not purport to replace actual review classes and formal teacher education.

This novel collection of review materials is composed of eleven book titles, two of which must be commonly shared by all reviewers (General Education and Professional Education) and nine for specializations. The nine books are devoted for the specialized subjects in

- English
- Filipino
- Mathematics
- Biological Science
- Physical Science
- Technology & Livelihood Education
- Social Science
- Values Education
- Music, Arts, Physical Education, and Health

Each book provides comprehensive content topics for its own area and is divided into course subjects which follow this format:

PART I – CONTENT UPDATE based on the PRC's prescribed competencies

PART II – ANALYZING TEST ITEMS made up of 25 questions, including the first five with corresponding answer and explanations

PART III – ENHANCING TEST-TAKING SKILLS composed of 25 practice exercise items. The answer key for the exercises is provided at the back of each book.

The authors of these books are considered experts in their disciplines, college mentors who also conduct the annual LET review classes of the Philippine Normal University, the National Center for Teacher Education.

The Visual Arts

Prepared by:
Laya A. Roman

Competencies:

1. Distinguish and analyze the different elements, principles, and mediums of different visual arts
2. Identify and classify the different themes of visual arts in the Philippines
3. Appreciate and be proud of Philippine visual art masterpieces as part of cultural enrichment.

PART I - CONTENT UPDATE

I. Definition of Terms

1. **Painting** - refers to the application of color, pigment, or paint to a surface or support. These surfaces may include paper, wood, canvas, metal, or walls. Paint is made of pigment mixed in a binder.
2. **Sculpture** - a three-dimensional artwork which may be made through different processes, such as carving, modeling, assembling, or casting. It may be executed as a free-standing object, in relief, or in environments, and a variety of media may be used.
3. **Architecture** – the art and science of designing spaces and constructing buildings (structures), and other environmental features.

II. The Elements of Visual Arts

1. **Line** – The most basic of all the elements. A line is a visible path traced by a moving point. Lines vary in types. They can be horizontal, vertical, diagonal, straight or curved, thick or thin. Different lines are used to signify different feelings, for example:
 - **Horizontal line** – rest, serenity, or perfect stability
 - **Vertical line** – dominance, height, power
 - **Diagonal line** – uncertainty, unrest, movement, or action
 - **Curved line** – flow, softness, flexibility, grace
2. **Shape** – Shapes and forms are figures which define objects in a space. A shape is a two-dimensional figure. Circles, triangles, and squares are common examples of shapes. Forms exist in three dimensions. Examples of forms include cubes, cylinders, and pyramids, among others.

3. **Value** – it is the relative degree of lightness or darkness in anything that is visible. It gives an impression of solidity, distance, and depth. Early Europe artists used a technique which is defined by a strong contrast between light and dark. This is called *chiaroscuro*.
4. **Color** – it is the product of light reflected off objects. We see different colors because of light's various intrinsic qualities, specifically, because of its different wavelengths. In visual arts, the relationship of colors is best seen in a color wheel.
 - **Primary colors** – Red, Yellow, and Blue (Red, Green, Blue in light)
 - **Secondary colors** – Orange, Green, and Violet
 - **Tertiary colors** – Yellow Green, Blue Green, Blue Violet, Red Violet, Red Orange, and Yellow Orange

Artists usually use color harmonies. These are combinations of colors which the artist uses to convey his or her message through the element of color.

- **Monochromatic** – the use of a single color tint in different values or shades
- **Analogous** – 3 to 4 neighboring colors with one color in all mixtures
- **Complementary** – any two opposite colors on the color wheel
- **Split complementary** – any three colors wherein two of which are beside the complement of the third color.
- **Double split complementary or tetradic** – this color scheme uses four colors arranged into two complementary pairs
- **Triad** – three colors that form an equilateral triangle in a color wheel

Properties of color:

- **Hue** – identity or the quality by which we distinguish colors
Cool colors – colors which possess the dominance of blue
Warm colors – colors which possess the dominance of red or yellow
- **Value** – lightness or darkness of a hue

- **Intensity or Saturation** – refers to the strength of a hue
5. **Texture** – refers to surface characteristics. A surface may be rough, smooth, glossy, coarse, irregular, etc.
 6. **Space** – refers to the area in which an artist arranges elements in a composition. Space can be two-dimensional (2D) such as in painting and photography, or three-dimensional (3D), such as in sculpture and installations. Depth can also be suggested in two-dimensional works, by the application of linear perspective – a graphing of distances between objects.

Types of perspective:

- **One-point** – a representation of distance by means of converging lines.
- **Two-point** – There are two points in line with each other in a horizontal position. All lines converge on these two points.
- **Foreshortening** – the modification of an established scale in a drawing of the human figure to represent perspective.

III. The Principles of Design

1. **Balance** – the idea of visual equilibrium which gives an impression of stability or instability.
 - **Symmetrical Balance** – it has equal visual weight on either side of the canvas. It is visually stable.
 - **Asymmetrical Balance** – an uneven balance.
 - **Radial Balance** – a symmetrical balance wherein elements are distributed evenly around a central point.
2. **Proportion (or scale)** – refers to the size relationships of one part to another, and of the parts to the whole.
3. **Rhythm** – a visual rhythm is characterized by the repetition or alternation of

elements.

Rhythm can be:

- **Regular** – repetition of a single motif
- **Alternating** – use of two different motifs alternately
- **Flowing** – a smooth and graceful type of rhythm
- **Progressing** – motifs may be presented in a gradual shift in characteristics, like size (from small to large)

4. **Emphasis and Subordination** – An emphasis is the focal point that rests on the subordinate space and easily attracts the attention of the viewer. To emphasize means to draw attention to essential parts of a composition.
5. **Unity** – (also called Harmony) refers to the coherence of the elements of a work to the whole.
6. **Variety** - The use of differences and change to increase the visual interest of the work.

IV. The Visual Arts (Painting, Sculpture, and Architecture)

A. Painting

Early mediums in painting

- **Encaustic** – this is a mixture of pigment, wax (beeswax), and resin.
- **Fresco** – pigment mixed with water and applied to thin layers or either dry plaster or wet plaster.
- **Tempera** – a fast-drying medium which is pigment mixed with a glutinous material (usually egg yolk).
- **Ink** – a medium containing pigments or dyes which may be in liquid or paste form and is used for pen and brush drawing, or printing.

Common mediums used in contemporary painting

- **Oil paint** – consists of pigment mixed with oil (linseed oil) as its binder. It dries slowly, but lasts long.
- **Watercolor** – consists of pigment combined with water and gum arabic. Colors are less luminous, and transparent.
- **Acrylic** – a quick-drying synthetic medium with emulsion as its binder. It is favored by a lot of artists because of its ease of use and its versatility.

Selected Styles/ Movements in Western Art

- **Realism** – a naturalistic approach to subject matter.
- **Impressionism** – a style wherein paintings are usually done outdoors. Brushstrokes are fast and colors used are light or pastel.
- **Expressionism** – an art movement that centers on the expression of inner emotions. Colors used are vibrant and distortion is usually used.
- **Abstract** – non-representational or non-figurative imagery. It could also be a distortion or simplification of forms.
- **Dada or Dadaism** – an aggressive reaction against conventional art. Dadaists produced (anti) art objects using unconventional methods.
- **Surrealism** – an art movement where artists gathered inspiration from the depths of the subconscious mind.
- **Pop Art** – an art movement which is centered on, or inspired from familiar images of popular culture, such as advertisements, comics, and commercial products.
- **Social Realism** – an art movement which portrays social and racial injustice and economic hardship, marked by its realistic depiction of social problems

Notable Philippine painters and their works:

19th century

- **Jose Honorato Lozano** – known for paintings of letras y figures.
- **Damian Domingo** – He headed the Academia de Dibujo y Pintura in 1821. He is known for his paintings of tipos del pais.
- **Juan Luna** – His work *Spoliarium* won the gold medal in the 1884 Exposicion Nacional de Bellas Artes.
- **Felix Resurreccion Hidalgo** – *Las Virgenes Cristianas Expuestas al Populacho* won the silver medal in the 1884 Exposicion Nacional de Bellas Artes.

20th century

Genre painters

- **Fabian dela Rosa** – *Women working in a Rice Field* (1902)
- **Fernando Amorsolo** – *Fruit Gatherers* (1950), *Sunday Morning going to Church* (1953)

The “Triumvirate of modern art”

- **Victorio Edades** – *The Builders* (1928)
- **Galo Ocampo** – *Brown Madonna* (1938), *The River of Life* (1954)
- **Carlos “Botong” Francisco** – *Harana* (1957)

Other Modernists

- **Hernando Ocampo** – *Homage to Tandang Sora* (1977)
- **Diosdado Lorenzo** – *Ilog ng Cabiao* (1970)
- **Vicente Manansala** – *Madonna of the Slums* (1950)
- **Cesar Legaspi** – *Gadgets II* (1949)
- **Anita Magsaysay-Ho** – *Fruit Vendors* (1975)
- **Jose Joya** – *Pagdiriwang* (1976)
- **Arturo Luz** – *Black Form, White Space* (1976)

Selected contemporary artists

- **Antipas Delotavo** – *Itak sa Puso ni Mang Juan* (1977)
- **Benedicto Cabrera** – *EDSA Event* (1986)
- **Danilo Dalena** – *Komedya sa Pakil*
- **Onib Olmedo** – *Mother and Child*
- **Brenda Fajardo** – *Baraha ng Buhay Pilipino* (1989)

B. Other related Visual Arts

- **Mosaic** – small pieces of colored stone or glass glued on the surface
- **Tapestry** – fabrics with colored designs which are woven in a pattern.
- **T’nalak** - an indigenous woven fabric made from abaca by the T’boli tribe of South Cotabato
- **Printmaking** – creation of a picture or design by printing from a plate that holds ink or color.
- **Photography** – the art of creating pictures by recording light into a sensitive medium, such as film.

C. Sculpture

Mediums used in sculpture

- Wood, metal, stone, granite, marble, wood, jade, ivory, brass, gold, lead, aluminum, glass, clay, plastic, bronze and others.

Processes/Techniques used in sculpture

- **Additive**
Modeling – process of creating a form through altering the figure of a medium, such as clay.
Molding and Casting – a complex process of creating a negative and positive replica from a model. It is ideal for mass production.
Assemblage – putting together found objects
Welding – process of joining metals

Mobile – kinetic or moving sculpture

Pottery – the process of shaping a material to produce earthenware, stoneware, or porcelain.

- **Subtractive**
- Carving** – cutting away pieces of material until the desired form is reached.

Notable Philippine sculptors:

- **Mariano Madrinian** – a santero from Paete, Laguna
- **Guillermo Tolentino** – Bonifacio Monument, UP Oblation
- **Napoleon Abueva** – Judas' Kiss (1955), Allegorical Harpoon (1964)
- **Lamberto Hechanova** – Crucifix
- **Abdulmari Imao** – Sarimanok (1975)
- **Eduardo Castrillo** – Pieta (1966)
- **Solomon Saprid** – Tikbalang (1971)
- **Ramon Orlina** – Venus V (2006)
- **Roberto Feleo** – Tau-Tao (1994)

D. Architecture

Architectural styles depend on different conditions, such as regional climate, geographical location, and different aspects of life – social, political, economic, spiritual, ideological, and technological. These styles also vary through time. Western classical architectural works were bound to the conventions of classicism, which include balance, proportion, and an emphasis on form. Baroque and Rococo's energetic styles include intense ornamentation both on the interior and exterior. Modernist architecture tends to become more straightforward and minimal.

Commonly used materials:

- **Organic** – wood, bamboo, yakal, sawali, etc.

- **Construction** – cement, sand, gravel, reinforced concrete
- **Stone** – adobe, granite
- **Fabricated materials** – bricks, tiles, glass
- **Metal** – structural steel, steel bars
- **Synthetic materials** – plastic, rubber

Brief history of Philippine architecture:

Pre-colonial period

- Native houses were single-room constructions built using indigenous materials (bamboo, palm leaves, etc.) Roofs were typically pyramidal, windows were wide and the floor was raised above the ground.

Spanish colonial period

- The Spaniards introduced European styles in architecture and started the construction of numerous churches. Some of today's famous Baroque churches include the San Agustin Church in Intramuros, the Paoay Church in Ilocos, and the Miag-ao Church in Iloilo.
- The bahay na bato was also formed.
- This period also marked the construction of the walls of Intramuros.

American occupation

- The arrival of the Americans signaled the emergence of monumental neo-classical structures.
- Daniel H. Burnham was sent by the US government to create urban plans for Manila and Baguio.
- Juan Arellano designed the Manila Post Office, Legislative building, and the Manila Metropolitan Theater.
- Antonio Toledo designed the Manila City Hall, and the Agriculture and Finance buildings at the Agrifina circle in Luneta
- Tomas Mapua designed the Philippine General Hospital and the Normal School

- Juan Nakpil – responsible for the rebuilding of the Quiapo Church in 1930

Middle to late 20th century

- Leandro V. Locsin was commissioned by the Marcos administration to design numerous edifices for the government. Among these are: The Cultural Center of the Philippines (CCP), and the Philippine International Convention Center (PICC). Locsin also designed the Church of the Holy Sacrifice at UP Diliman.
- Froilan Hong – Manila Film Center
- Francisco Mañosa – Coconut Palace
- Mañosa Brothers – San Miguel Building, Ortigas

E. Notable Art forms in Asia

Art Forms and Symbols common in Asia

- **Batik** - A technique of dyeing cloth which includes the use of removable wax to repel the dye on parts of a design. Batik or fabrics with the traditional batik patterns are found in Indonesia, Malaysia, Japan, China, and India.
- **Calligraphy** - decorative art of lettering in an ornamental style. This is particularly well-known in East Asian arts.
- **Wat** – an entire religious complex with multiple buildings. Numerous wats are found across Asia, especially in Thailand and Cambodia.
- **Mandala** – In Buddhism, a diagram with pictures or statues of gods in specific positions. Mandala literally means “circle”.
- **Stupa** – An architectural form which originated in pre-Buddhist India. It can either be a burial marker or container of precious relics.
- **Pagoda** - a tiered tower with several eaves. Pagodas are derived from the Indian stupa and are most commonly Buddhist.
- **Masjid** – commonly known as “Mosque”, a place of worship for follo-

wers of Islam. One of its architectural features is the minaret, a tall spire from which summons to prayer are called.

- **Naga** – literally means “snake” but normally refers to serpent deities. The Naga motif is found in both Hinduism and Buddhism and is present in different Southeast Asian countries.
- **Apsara** – In Hindu and Buddhist mythology, a female spirit of the clouds and waters, or a nymph of the sky.
- **Jataka** – tales of the lives of the Buddha, found in different parts of Asia, such as on the walls of Indonesia’s Borobudur temple.
- Ancient pottery and ceramics are also found all across the Asian continent.

Famous architectural works in Asia:

- **India** – Taj Mahal, Kandariya Mahadeva temple
- **China** – The Forbidden City (Palace complex), The Great Wall of China
- **Japan** – Himeji Castle, Osaka Castle, traditional Japanese gardens
- **Cambodia** – Angkor Wat (Hindu temple)
- **Thailand** – Wat Phra Kaew, Wat Arun (Buddhist temples)
- **Myanmar** – Shwedagon Pagoda, Ananda Temple (Buddhist temples)
- **Malaysia** – Zahir Mosque, Ubudiah Mosque
- **Indonesia** – Borobudur (Buddhist temple), Prambanan (Hindu temple)

Indian Art

- Indian art is deeply rooted on religious beliefs, primarily on Buddhism and Hinduism. Multitudes of Buddhist and Hindu paintings, sculptures, and architecture are found in the Indian subcontinent and its influences scattered all across Asia.
- An example is the Great Stupa in Sanchi, India. It was built around the 3rd century B.C.E.
- Numerous temples and sculptures of the Buddha were made. One of these structures includes the Kandariya Mahadeva temple.

- Hindu and Buddhist images are usually depicted showing a specific mudra, a symbolic gesture. Most mudras are performed with the hands and fingers, and some involve the entire body.
- A new culture developed in India with the arrival of the Mughals, an Islamic people from Central Asia. Persian forms mixed with Indian elements to create a uniquely Indian form of Islamic art. The most celebrated Mughal architecture in India is the Taj Mahal.

Chinese Art

- The arts of China are shaped by different succeeding dynasties and influenced by different philosophies such as Confucianism, Taoism, and Buddhism.
- Chinese Brush Painting
- Started around 4000 BC, executed by using a Chinese brush and Chinese ink. The same ink is used in calligraphy, and is applied to either paper or silk.
- Usual subjects are landscapes (4th century), and birds and flowers (9th century).
- One essential rule in painting: “See the great in the small” and “See the small in the perspective of the great”
- Qualities of Chinese Brush Painting (Lu Ch’ang)
 - o To display brushstroke power with good brushwork control
 - o To possess sturdy simplicity with refinement of true talent
 - o To possess delicacy of skill with vigor of execution.
 - o To exhibit originality, even to the point of eccentricity, without violating the li (the principles or essence) of things.
 - o In rendering space by leaving the silk or paper untouched, to be able nevertheless to convey nuances of tone.
 - o On the flatness of the picture plane, to achieve depth and space
- In sculpture, the accidental discovery of the buried terracotta army

(221 B.C.E) was one of the most stunning moments in archaeology. It is a collection of terracotta sculptures representing the armies of Qin Shi Huang, the first Emperor of China.

Japanese Art

- Traditional arts were influenced by Shinto, the indigenous spirituality of the people of Japan. Eventually, Zen Buddhism from China also became a dominant influence in Japan’s arts and culture.
- **Ukiyo-e** – A genre of art, mainly in the medium of woodblock print. It is an old and common art form and its subjects include narratives from history, landscapes, and townscapes, among others. Katsushika Hokusai was known in this genre.
- **Types of traditional painting** - Buddhist painting (Butsuga), Scroll painting (Emakimono), Ink painting (Suibokuga), Screen and Wall Painting (Shoheiga).
- **Japanese Gardens** – gardens with symbolic aesthetics arising from the expression of Shinto beliefs and Buddhist intellectual conventions.
- **Ikebana** – Japanese flower arrangement with origins in early Buddhist flower offerings. It developed into a distinctive art form in the 15th century.
- **Origami** – the art of paper folding, which started around the 17th century.
- **Bunraku** – Japanese puppetry which developed also in the 17th century.

Korean Art

- The earliest historical record of painting in Korea comes from the area of Lelang in Korea where a tradition of painting existed from sometime around 108 B.C.
- Korean Painting was deeply influenced by Chinese art.
- Painting was also very evident on the walls of the Koguryo tombs. The

murals are strongly colored and show daily life and Korean mythologies of the time.

Indonesian Art

- Indonesian traditional arts are rooted on Buddhism and Hinduism. Even though the nation is predominantly Islamic at present, cultural heritage is well preserved.
- Wayang - a Javanese term for particular kinds of theatre. These are usually accompanied by a gamelan, a musical ensemble composed of different metallophones.
 - Wayang Kulit – traditional Indonesian shadow play/ shadow puppets
 - Wayang Golek – wooden rod puppets
 - Dalang - the puppeteer in an Indonesian wayang performance.

Vietnamese Art

- Pottery in Vietnam dates back to the Stone Age. In the Bronze Age, the Dong Son culture developed unique drums cast in bronze. These are known as the Dong Son drums.
- Lacquer Painting – paintings applied on wood. A wooden panel is covered with a piece of cloth glued to it using the sap of a lacquer tree. This is then coated with a layer of the sap mixed with earth. The board is then polished and recoated with another layer of sap.
- Lacquer paintings incorporate the traditional colours -- brown, black, red, yellow, white -- and the technique of inlaying egg, crab and snail shells.
- As far back as the 11th century, lacquer was widely used in the ornamentation of palaces, communal halls, temples, pagodas and shrines.
- Water Puppetry – a tradition of water puppets which may have started in the 12th century. It is still a very popular art form in Vietnam.

PART II – ANALYZING TEST ITEMS

1. In Architecture, needs of people are provided for by high-rise buildings through efficient utilization of limited spaces. How is space maximized in the most comprehensive manner?
 - A. Reinforced concrete, structural and pre-fabricated units are used for the structure and plastic, glass and other synthetic materials are used for finishing touches.
 - B. High-rise structures contain mechanical equipment like air-conditioning units, elevators, and fire protection systems.
 - C. A building is built with all functional needs like commercial establishments, offices, residential areas, parking spaces, and other multi-functional features.
 - D. Massive and monumental structures are evidences of progress and modernization.

The correct answer is **C**. High-rise structures possess limited space but are extended upward to house different functional features in one area, such as residential, recreational, commercial, business, and others.

Option A pertains to materials only used in construction

Option B is the use of technology in building construction

Option D refers the kinds of buildings during the Marcos Regime

2. When a painting is labeled as “Art for the People”, what particular issue(s) is the main focus of the artist?
 - A. Early religious art commissioned by the early church, for believers and pilgrims
 - B. Art which is commissioned by the ruling powers, for mass propaganda

- C. Art which is centered on, or inspired from familiar images of popular culture, such as advertisements, comics, and commercial products.
- D. The connection of art works to various nationalistic struggles, social realism and activism.

The correct answer is **D**. "Art for the people" is interwoven in the society's social, economic, and political fabric.

Option A is an issue about the religion and religious art
Option B is pertains to art as propaganda
Option C refers to Pop Art

- 3. From the different techniques in sculpting, carving is considered the most painstaking and time consuming process. What makes it so?
 - A. Different tools are used as the artist chips off pieces of the medium little by little until the desired image is achieved.
 - B. It involves adding or building up pieces of the medium little by little to form the desired image
 - C. A finishing method of firing and glazing is needed at the end of the whole process.
 - D. The process is composed of two stages: creating a negative, then a positive

The answer is A – Carving involves a slow but precise process of cutting away parts of a medium, such as wood.

Option B is a process of additive specifically assemblage or modeling
Option C is about steps used as finishing touches in pottery
Option D is a process used in casting

- 4. In technical drawing, perspective is used to locate an object in a space. Which kind of perspective represents distance by means of converging lines?
 - A. Foreshortening perspective
 - B. Aerial perspective
 - C. One point perspective
 - D. Two-point perspective
- 5. A Javanese term used for particular kinds of theater. It may include shadow puppets, or wooden rod puppets.
 - A. Wayang Kulit
 - B. Wayang
 - C. Wayang Golek
 - D. Wayang Orang
- 6. Which of the following beliefs/philosophies did not have a great influence on Chinese arts?
 - A. Buddhism
 - B. Confucianism
 - C. Taoism
 - D. Shintoism
- 7. Lines, when used by an artist, may suggest meanings. What meaning/s may be associated with a vertical line?
 - A. Depression
 - B. Dominance
 - C. Motion and mobilization
 - D. Continuity and grace
- 8. What is the resulting color if we combine of all primary-colored lights?
 - A. gray
 - B. black
 - C. white
 - D. brown
- 9. If an artist uses yellow and violet for his painting, what type of color harmony is he using?
 - A. Triad
 - B. Complementary
 - C. Double complementary
 - D. Split complementary

10. The use of one color with different tints or shades is seen in some works of art. What is the term for using one color with different shades?
- A. Light and shadow C. Monochromatic
B. Analogous D. Complementary
11. Which of the following statements about art is false?
- A. Art is readily appreciated by all people, regardless of culture.
B. Art refers to a process or product of creative skill.
C. Art reflects the characteristic of a certain period in mankind's history.
D. Art may be a 'mimesis', a representation of reality.
12. When an architect designs a building, he wants to answer _____.
A. the needs of men C. the demands of men
B. the satisfaction of men D. all can be considered
13. There are many mediums used in painting. What kind of traditional paint uses egg yolk as its binder?
- A. water color C. oil paint
B. fresco D. tempera
14. Two processes are used in sculpting. One is additive and the other is subtractive. What type of additive technique is used if you put together different objects or scraps?
- A. assemblage C. welding
B. molding D. casting
15. What kind of style in the arts is an unembellished, naturalistic approach to subject matter?
- A. Impressionism C. Realism
B. Modernism D. Expressionism
16. After World War I, there were artists who started an aggressive reaction against established conventions in art and aesthetics. What is the name of this "art movement"?
- A. Fauvism C. xpressionism
B. Modernism D. Dadaism
17. Which western art movement was inspired from familiar images of popular culture, such as advertisements, comics, and commercial products?
- A. Expressionism C. Romanticism
B. Pop art D. Commercialism
18. Philippine modern sculptors use different mediums and styles in their pieces. Who is the sculptor who usually finished his welded sculpture without polishing its surface, as seen in his works "Tikbakang" and "Penitensiya"?
- A. Napoleon Abueva C. Solomon Saprid
B. Arturo Luz D. Eduardo Castrillo
19. A painter/muralist from Angono, Rizal, who is fond of folk scenes. He is also known as "Botong".
- A. Fernando Amorsolo C. Vicente Manansala
B. Victorio Edades D. Carlos Francisco
20. A sculptor and National Artist from Mindanao known for his sculpture "Sari manok".
- A. Abdul Mohammed C. Ismail Acar
B. Abdulmari Imao D. Abed Abdi
21. The small figurines for sale in malls are identically produced sculptures. What process is used to create these items?
- A. welding C. casting
B. modeling D. carving

22. The Triumvirate of Modern Art is composed of three popular artists who are promoters of mural painting. Two of whom are Carlos Francisco and Victorio Edades, Who is the third one?
- | | |
|---------------------|----------------------|
| A. Fabian dela Rosa | C. Arturo Luz |
| B. Galo Ocampo | D. Vicente Manansala |
23. A tiered tower with several eaves. Its structure is derived from the Indian stupa and is most commonly Buddhist.
- | | |
|-----------|------------|
| A. Wat | C. Pagoda |
| B. Temple | D. Minaret |
24. Which Filipino sculptor was known for the Bonifacio Monument in Caloocan, and the UP Oblation?
- | | |
|--------------------|------------------------|
| A. Napoleon Abueva | C. Guillermo Tolentino |
| B. Solomon Sapid | D. Ramon Orlina |
25. Painting in China is popularized with the use of two painting instruments/ media. What are these media?
- | | |
|-------------------------|-----------------------------|
| A. watercolor and paper | C. wooden panel and tempera |
| B. oil and canvas | D. brush and ink |

PART III – ENHANCING TEST TAKING SKILLS

- When you create a three-dimensional artwork through different processes such as carving, modeling, assembling, or casting, the visual art being considered is _____.

A. sculpture	C. painting
B. architecture	D. printmaking
- Lines may be used to create an impression of flow and gracefulness. When one is drawing, which line best suits the characteristic mentioned?

A. diagonal	C. straight
B. horizontal	D. curved
- A genre of art in Japan, mainly in the medium of woodblock print. It is an old and common art form and its subjects include narratives from history, landscapes, and townscapes.

A. Bunraku	C. Butsuga
B. Suibokuga	D. Ukiyo-e
- In Hindu and Buddhist mythology, this symbol refers to a female spirit of the clouds and waters, or a nymph of the sky.

A. Avadana	C. Apsara
B. Mandala	D. Jataka
- If you want to make your subject appear to have depth and seem realistic, which element of art should you focus on?

A. shape	C. texture
B. value	D. line

6. This principle of design is the most important of all. It refers to the coherence of the elements of a work to the whole.
- A. rhythm C. balance
B. proportion D. unity
7. We like to see things in proper scale. When we see objects having the proper relationships to each other (in size), the principle of art that we are referring to is _____.
- A. rhythm C. balance
B. proportion D. harmony
8. To attract attention, the emphasis should rest or lie on the subject. The space that helps to intensify focus on the emphasis is called _____.
- A. interest C. action
B. subordinate D. attraction
9. This painting medium is a mixture of pigment and water, applied to wet or dry plaster.
- A. fresco C. oil
B. tempera D. water color
10. Some contemporary artists prefer this new painting medium because of its ease of use. It is synthetic and uses emulsion as its binder. What medium in painting are we referring to?
- A. encaustic C. watercolor
B. acrylic D. charcoal
11. This refers to a broad movement in the arts and social sciences which encompasses the activities and output of those who felt that "traditional" forms of art are outdated.
- A. Realism C. Surrealism
B. Cubism D. Modernism
12. Jackson Pollock typically drips or aggressively splashes paint on his canvas. This refers to which style of painting?
- A. Impressionism C. Abstract expressionism
B. Expressionism D. Popular Art or Pop Art
13. After classical trends in Philippine sculpture, later sculptors began to embrace the styles of modernism in their artworks. Which modern sculptor was known for his works Judas' Kiss and Transfiguration and Kagampanan?
- A. Eduardo Castrillo C. Napoleon Abueva
B. Guillermo Tolentino D. Roberto Felelo
14. Juan Luna's painting, Spoliarium, shows the ill fate of fallen Gladiators after a brutal tournament. By saying so, what aspect of an artwork are we referring to?
- A. Form C. Content
B. Medium D. Context
15. Styles and designs of architectural works reflect the demands of different aspects in life. Which are considered before designing a structure?
- A. Social and economic C. Technological and geographical
B. Political and ideological D. All of the above
16. The Miag-ao, San Agustin, and Paoay church's architectural designs are in accordance with which western style?
- A. Renaissance C. Neo-Classical
B. Baroque D. Gothic
17. Some native Philippine architecture possesses motifs, like the naga, which may be seen in other countries. Where did we get this influence?
- A. Southeast Asia C. America
B. Spain D. Japan

18. Numerous monumental structures possessing Greco-Roman motifs were built in Manila during the American occupation. These include the City Hall, the former Legislative building, and the Post Office. What is the dominant style of these architectural icons?
- A. Baroque C. Gothic
B. Renaissance D. Neo-Classical
19. One of the pioneers in Philippine architecture; he was responsible for the rebuilding of the Quiapo Church in 1930. He is _____.
- A. Juan Arellano C. Jose Mañosa
B. Juan Nakpil D. Leandro Locsin
20. In painting, what is the term in art used for a technique in painting which is utilized to illustrate a striking contrast between light and dark?
- A. Contrapposto C. Caravaggio
B. Chiaroscuro D. Sfumato
21. Which among these Filipino painters is not a modernist?
- A. Victorio Edades C. Damian Domingo
B. Arturo Luz D. Vicente Manansala
22. In the 1840s, Jose Honorato Lozano was known for this unique Filipino art form, wherein a name is painted with letters contrived with people and objects.
- A. Miniaturismo C. Genre painting
B. Letras y Figuras D. Modernist painting
23. If you were to build a structure in accordance with the Modernist style, which of the following would best describe your design?
- A. It possesses Greco-Roman motifs
B. It is straightforward and minimal.
C. It is energetic and ornamented.
D. All of the above
24. This is a kind of woven fabric made by the T'boli tribe in South Cotabato.
- A. hagabi C. bulul
B. t'nalak D. kulintang
25. Some artists paint images from their dreams. Which is a Western art movement where artists gathered inspiration from the depths of the subconscious mind?
- A. Surrealism C. Abstract
B. Expressionism D. Cubism

Integrated Music Theory

Prepared by:
Prof. Luzviminda B. Modelo

Competencies:

1. Distinguish and analyze different elements and related concepts in music.

PART I - CONTENT UPDATE

Music is an art of organized sounds which expresses ideas and emotions in significant forms through the elements of rhythm, melody, form, harmony and timbre-dynamics.

Every single tone has four qualities – pitch, intensity, duration and timbre – which are perceptible to the human ear.

1. **Pitch** – is the highness or lowness (or height or depth) of a musical sound.
2. **Intensity** – is concerned with the strength or weakness (or loudness or softness) of sound.
3. **Duration** – covers the length of time between the beginning (attack) and the end (decay) of a sound.
4. **Timbre** – the distinctive quality or tone color of each instrument/voice which makes one sound different from another even when they are both producing the same pitch with equal intensity and duration.

MUSICAL ELEMENTS

- A. **RHYTHM** – is the flow of music through time.
 - **Beat** – is a regular, recurrent pulsation that divides music into equal units of time.
 - **Meter** – the organization of beats into regular groups.
 1. **Simple Meter** – is division of time where the fundamental pulses subdivide into groups of two, four, etc.
 2. **Compound Meter** – is a division in which the fundamental pulses subdivide into groups of three, six, twelve, etc.

3. **Polymeter** – is double meter to indicate that two meters are combined or there is constant change from one meter to the other back and both.
- **Time Signature** – consist of two numbers. The upper number indicates the number of beats for every measure and the lower number indicates what kind of note receives one beat.
 - **Rhythmic Pattern** – is the division of beats into patterns of sound. A combination of notes and rests found in one measure of a given time signatures.
 - **Syncopation** – is musical process that involves adding an unexpected element to the basic beat of a musical composition. A dislocation of the strong accents within a measure.
 - **Accent** – stress or added emphasis given to a note.
- B. **MELODY** – is a series of single notes that add up to a recognizable whole. Melodic directions of movement are going up, going down and repeated.
- **Pitch** – the highness and lowness of a sound.
 - **Key Signatures** – consists of sharps and flats.
 - **Scale** – is a group of musical notes collected in ascending and descending order.
- C. **TEMPO** – rate or speed in music
- **Andante** – moderately slow
 - **Allegro** – fast
 - **Moderato** – moderately
 - **Lento** – slow
 - **Vivace** – lively
- **Presto** – very fast
 - **Accelerando** – gradually becoming faster
 - **Ritardando** – gradually becoming slower
- D. **DYNAMICS** – the loudness and softness in music.
- **Fortissimo (ff)** – very loud
 - **Pianissimo (pp)** – very soft
 - **Mezzo Piano (mp)** – half soft
 - **Mezzo Forte (mf)** – half loud
 - **Crescendo** – gradually becoming louder
 - **Decrescendo** – gradually becoming softer
- E. **FORM** – the structure or framework of a composition.
- **Tone** – smallest unit of a composition.
 - **Figure** – smallest characteristic group of a tone
 - **Motive** – is a tone group that may be identified with a particular composition.
 - **Phrase** – is a succession of tones arranged in such a way as to give a musical thought.
 - **Period** – a complete musical thought consisting of two phrases in Question and Answer.
 - **Section** – a combination of periods.
 - **Unitary** – consist of one part.
 - **Binary** – consist of two parts.
 - **Ternary** – consist of three parts.
 - **Rondo** – consist of more than three parts.
- F. **TIMBRE** – is the qualifying difference between one tone and another. The color of sound produced by the voice and different instrument.

- Soprano
- Alto
- Tenor
- Bass
- Orchestral Instruments
- Rondalla Instruments

G. **TEXTURE** – is the relationship of melodies (horizontal) and harmonic (vertical) elements in music. Produce qualities of lightness or heaviness, thickness or thinness.

- **Monophonic** – single unaccompanied melodic line.
- **Polyphonic** – consist of two or more melodic lines.
- **Homophonic** – one main melody accompanied by chords.

H. **HARMONY** – is the simultaneous sounding of a group of tones. The vertical relationship between a melody and its accompanying chords or between melodies simultaneously played or sung.

- **Triad** – consist of three notes: the root, 3rd and 5th.
- **Chord** – a musical sonority consisting of three or more tones sounded simultaneously.

PART II – ANALYZING TEST ITEMS

1. What is the meter of music when the time signature is a fast 6/4 ?
a. simple duple c. simple triple
b. compound duple d. compound triple
2. In cut time music, how many beats will a dotted half note receive?
a. 3 beats c. one and a half beat
b. 2 beats d. one beat

3. Which does not have a syncopated rhythm?

4. Complete this measure:

5. What interval can be found between the 6th and the 7th notes of a harmonic minor scale?
 - a. whole tone
 - b. 3 semi tones
 - c. semitone
 - d. 2 whole tones
6. The resulting interval of an inverted diminished 5th is _____.
 - a. perfect 5th
 - b. perfect 4th
 - c. diminished 4th
 - d. augmented 4th
7. The enharmonic note of G double sharp is _____.
 - a. F double sharp
 - b. A Double flat
 - c. F
 - d. A
8. Keys having the same key signature but different tonic notes.
 - a. parallel keys
 - b. relative keys
 - c. tonic keys
 - d. perfect keys
9. The first note of a mode is called _____.
 - a. finalis
 - b. tenor
 - c. confinalis
 - d. dominant
10. A grace note that has no definite time value and is usually played as quickly as possible.
 - a. Turn
 - b. Appoggiatura
 - c. Acciacatura
 - d. mordent
11. A property of tone that is concern with the weakness and strength; or the softness or loudness of tone
 - a. duration
 - b. timbre
 - c. sonority
 - d. intensity
12. Which of the following songs follows the unisectional form?
 - a. Leron-Leron Sinta
 - b. Pambansang Awit
 - c. Plilipinas Kong Mahal
 - d. Bituing Marikit
13. The underlying principle in this form is the recurrence of a main theme which alternates with one or more subordinate themes.
 - a. rondo
 - b. theme and variation
 - c. ternary
 - d. sonata allegro
14. All these songs are in strophic form, except for one. Which one is it?
 - a. Bahay Kubo
 - b. Leron-Leron Sinta
 - c. Pamulinawen
 - d. Sitsiritsit
15. What is the missing 3rd note in this diminished triad, when the root and 5th

 are given:
 - a. D
 - b. Db
 - c. D#
 - d. Dbb
16. What kind of triad is formed on the 3rd note of a harmonic minor?
 - a. Major
 - b. minor
 - c. augmented
 - d. diminished
17. A congregation of people singing in a worship service in unison is likely to produce _____ texture.
 - a. monophony
 - b. homophony
 - c. polyphony
 - d. heterophony

18. The gradual increase in volume.
- a. crescendo
 - b. diminuendo
 - c. accelerando
 - d. decrescendo
19. Which does not belong to the group?
- a. Symphony No.5 in Cm (Beethoven)
 - b. Piano Concerto No. 7 (Tchaikovsky)
 - c. Moonlight Sonata (Beethoven)
 - d. Etude No.3 (Chopin)
20. The highest and lowest tones an instrument or voice is capable of playing/singing.
- a. register
 - b. pitch
 - c. range
 - d. direction

PART III – ENHANCING TEST TAKING SKILLS

1. The _____ fixes or assigns the second line of the staff as G.
 - a. Treble clef
 - b. bass clef
 - c. tenor clef
 - d. alto clef
2. What is the key when the key signature is consisting of 5 sharps?
 - a. E min.
 - b. F# min.
 - c. G# min
 - d. D# min.
3. The semitones in a major scale are found between the _____ notes.
 - a. 2nd and 3rd; 5th and 6th
 - b. 3rd and 4th; 7th and 8th
 - c. 4th and 5th; 7th and 8th
 - d. 2nd and 3rd; 7th and 8th
4. One section set to 2 or more stanzas is called _____.
 - a. Strophic
 - b. binary
 - c. rondo
 - d. ternary
5. A single melodic line performed without any accompaniment is said to be _____.
 - a. Monophonic
 - b. homophonic
 - c. polyphonic
 - d. heterophonic
6. A curved line indicating that all notes under it are to be played in a very connected and smooth way.
 - a. Slur
 - b. tie
 - c. legato
 - d. portato
7. A clef sign that fixes the 3rd line as middle C.
 - a. Bass clef
 - b. soprano clef
 - c. alto clef
 - d. tenor clef

8. Chromatic signs that do not belong to the key signatures.
 - a. Accidental
 - b. natural
 - c. sharp
 - d. flat
9. The third note of the scale is called _____.
 - a. Tonic
 - b. supertonic
 - c. mediant
 - d. sub-mediant
10. _____ is characterized as one melody performed by several groups with slight melodic and/or rhythmic alterations.
 - a. Monophony
 - b. homophony
 - c. polyphony
 - d. heterophony
11. The present day minor scale is the same as the _____ mode.
 - a. Dorian
 - b. Locrian
 - c. Aeolian
 - d. Ionian
12. Passage from one key or mode to another.
 - a. Modulation
 - b. Tonality
 - c. Transposition
 - d. Progression
13. Notation or performance of a composition in a different key from the one in which it was originally written.
 - a. Modulation
 - b. Tonality
 - c. Transposition
 - d. Progression
14. Diminished 6th below A flat
 - a. C sharp
 - b. B
 - c. C flat
 - d. D flat
15. The parallel major of G minor is _____.
 - a. E minor
 - b. G major
 - c. B flat major
 - d. E flat minor
16. What is the relative minor key of F sharp major?
 - a. C sharp minor
 - b. A minor
 - c. D sharp minor
 - d. E minor
17. A direction to perform the passage in a smooth and connected manner, with no break between the tones.
 - a. Legato
 - b. Staccato
 - c. Portato
 - d. Trill
18. A kind of form in which the theme is followed by a repetitions which focus on alterations in each variation- in the rhythm, harmony, melody, texture and color of the theme.
 - a. Rondo
 - b. theme and variation
 - c. Sonata- allegro form
 - d. Scherzo
19. Melodic formulas that are used to decorate or embellish a melody.
 - a. Ornaments
 - b. augmentation
 - c. trill
 - d. arpeggio
20. It is used to lower a note by a whole step
 - a. Flat
 - b. double flat
 - c. natural
 - d. sharp

Conducting, Instrumental and Local Groups

Prepared by:
Prof. Luzviminda B. Modelo

Competencies:

1. Distinguish the elements of vocal and instrumental ensemble performance
2. Identify the essentials of conducting

PART I - CONTENT UPDATE

The character of the tone produced by an instrument is called timbre, the fourth element of music. Each instrument and each type of human voice has its own quality of tone or color.

1. **Chamber Music Groups** – music intended for performance in an intimate setting, involving between one and approximate eight players, each playing an independent part.
 - **Solo** – one player
 - **Duo or duet** – two players
 - **Trio** – three players
 - **Quartet** – four players
 - **Quintet** – five players
 - **Sextet** – six players
 - **Septets**, octets, nonettes, etc., can be made up of various combinations of instruments.
2. **Larger Ensembles** – instrumental groups with more than eight to ten players usually perform with a conductor.
 - **String orchestra** – consist of first violins, second violins, violas, cellos and basses.
 - **Woodwind choir** – made up of flutes, oboes, clarinets and bassoons.
 - **Brass choir** – has French horns, trumpets, cornets, trombones and tuba.
 - **Percussion Ensemble** – has from two to ten players playing various combinations of percussion instruments.

- **Symphonic wind ensemble** – combination of a woodwind choir, a brass choir and a percussion ensemble.
- **Concert band** – usually has more than one player on each part.
- **Jazz ensembles** – vary from small ensemble such as piano, vibraphone, bass, and drums to large stage or concert jazz bands with five saxophones, (players may play also double flute, clarinet, oboe and bassoon) five trumpets, five trombones, piano, guitar, string bass and drums.
- **Chamber orchestra** – consist basically of the string orchestra plus a small number of additional keyboard, woodwind, brass or percussion instruments.
- **Symphony Orchestra** – composed of instruments from the string, woodwind, brass and percussion sections, occasionally with special instruments added.

Vocal Ensembles

1. **Chamber Ensembles** – may range from one to eight or more voices, with or without accompaniment.
2. **Large Vocal Ensembles**
 - Women's choruses – Soprano 1, Soprano 2, Alto 1 and Alto 2.
 - Men's choruses – Tenor 1, Tenor 2, Bass 1 and Bass 2.
 - Mixed Chorus – four grouping of soprano, alto, tenor and bass.
 - A Capella Choir – performs music without instrumental accompaniment.

CONDUCTING – this has been often defined as the art of leading a group through the use of bodily movements and facial expressions in the interpretation of vocal as well as instrumental compositions.

CONDUCTING ESSENTIALS

1. **Preparatory Beat** – prepares the singers to attack on the beat; this is usually the beat which comes before the attack beat; its purpose is also to allow the singers to breathe at the same time.
2. **Attack Beat** – start of the phrase.
3. **Release Beat** – end of the phrase or section—should be clearly seen by the choir members so that the cessation of the sound will be done altogether.
4. **Cueing** – usually done with the left hand—used for entrances of voice parts and dynamic or tempo changes, as well as in rhythm.

PART II – ANALYZING TEST ITEMS

1. What is the vocal composition of a mixed choir?
 - a. SSA
 - b. TTBB
 - c. SATB
 - d. SATC
2. Which does not belong to the group?
 - a. Oboe
 - b. Trumpet
 - c. Tuba
 - d. Trombone
3. Which is not true about the Rondalla?
 - a. Rondalla is also called comparsa
 - b. The higher sounding instrument and normally plays the melody is the LAUD
 - c. The drum set is an optional instrument in the Rondalla
 - d. The Spaniards introduced Rondalla in the Philippines
4. Which of the following is a tuned percussion instrument?
 - a. Maracas
 - b. Castanets
 - c. Tubular bells
 - d. Triangle
5. A smaller banduria is called _____.
 - a. Bandoneon
 - b. Laud
 - c. Piccolo
 - d. Bandola
6. The viol family produces sound by means of a _____.
 - a. Pua
 - b. Bow
 - c. Beater
 - d. Mallet
7. Instruments which are made to sound by striking them with special sticks, or by striking or shaking parts together
 - a. Stringed
 - b. Brass Wind
 - c. Wood wind
 - d. Percussion
8. The counterpart of the double bass in the woodwind family is the _____.
 - a. Sousaphone
 - b. Tuba
 - c. Bassoon
 - d. All of the Above
9. What would be the preparatory beat when the music starts on the 2nd half of the first beat?
 - a. Upbeat
 - b. Downbeat
 - c. 3rd beat
 - d. 2nd half of second beat
10. A list of songs/ music that a vocal group or instrumental group perform
 - a. Repertoire
 - b. Program
 - c. Catalogue
 - d. Concert
11. The highest voice in an all-female choir.
 - a. coloratura
 - b. soprano
 - c. mezzo soprano
 - d. contralto
12. A vocal problem wherein the singer sings on spilled air and not on controlled air.
 - a. pinched voice
 - b. hoity music
 - c. harm voice
 - d. breathy voice
13. Correct breathing in singing is conducted by an involuntary muscle called .
 - a. clavicle
 - b. diaphragm
 - c. intercostals
 - d. rectus abdominus
14. To obtain more stability with the choir intonation, position the sopranos next to _____.
 - a. basses
 - b. tenors
 - c. altos
 - d. conductor
15. The art of leading a group in the interpretation of music using hands, facial expressions and bodily movements.
 - a. beating
 - c. conducting

- b. interpretation d. cueing

16. Which does not belong to the group?

- a. gandingan c. babandil
b. sageypo d. agung

17. What is true about Palabunyibunyan?

- a. The Palabunyibunyan Ensemble can be found at the Southern part of the Philippines, mainly at Maguindanao.
b. The instruments of Palabunyibunyan are tagitak, busog, gandingan and agong.
c. The ensemble is composed of gangsa, topaya and gansa palook.
d. The traditional ensemble features both male and female kulintang players.

18. The distinctive quality of tone color of each instrument/ voice that makes one different from another.

- a. timbre c. texture
b. sonority d. harmony

19. The rapid back and forth movement of the right hand using pua or pick when playing plectrum instruments of the Rondalla is called _____.

- a. vibrato c. portato
b. legato d. tremolo

20. If Bahay Kubo is to be sung in legato and allegro with correct phrasing, the ideal beat pattern would be _____.

- a. one-beat pattern c. three-beat pattern
b. two-beat pattern d. four-beat pattern

PART III – ENHANCING TEST TAKING SKILLS

1. To what classification does the human voice belong?

- a. chordophone c. idiophone
b. aerophone d. membranophone

2. What is true about a coloratura soprano?

- a. It is capable of performing rapid scales, arpeggios, trills and other passages in the high register
b. It has a light tone quality and has a lyrical color
c. Has a powerful quality and the voice is suitable for music that demands emotional intensity
d. It has the qualities of the dramatic and lyric sopranos

3. An instrumental group composed of stringed, woodwind, brasswind and percussion instruments?

- a. band c. symphony
b. orchestra d. gamelan

4. When does a conductor give cues?

- a. when a section makes its initial entrance
b. a voice-line enters after being mute for a long period of time
c. when ending a phrase
d. when a melody moves from section to section

5. The Pangkat Kawayan is composed of the following instruments:

- a. patatag, bungkaka, tulali c. palendag, kudlong, kudyapi
b. kubing, litgit, bungbong d. bungbong, angklung, marimba

6. When conducting music that demands grandeur and majesty, the move-

- ments is initiated from the _____.
 a. forearm c. fingers
 b. wrist d. arm
7. The source of sound of the human vocal instrument.
 a. pharynx c. uvula
 b. glottis d. vocal folds
8. The source of vibration of instruments classified as idiophone is _____.
 a. Stretched membrane c. The instrument itself
 b. Electronic generator d. Column of air
9. What is a characteristic of a chamber orchestra?
 a. It is basically a combination of a woodwind choir, a brass choir and a percussion ensemble
 b. It is composed of saxophones, trumpets, trombones, piano, guitar, string bass and drums
 c. It consists basically of the string orchestra plus a small member of additional keyboard, woodwind, brass or percussion instruments
 d. It is composed by instruments from the string, woodwind, brass and percussion sections, occasionally with special instruments added
10. The movement for the release of sound is called _____.
 a. Cut-off c. Preparatory
 b. Caesura d. Cue
11. Proper breathing while singing means
 a. Raising the shoulders and sounding the breath especially during entrance.
 b. Contracting the stomach and chest muscles while inhaling.
 c. Controlling the breath output gradually
 d. Filling in the lungs and chest cavities with air and putting out all of the air together with the attack
12. Testing will always be part of the audition as this
 a. Will allow the singers to discover their strong and weak points
 b. Will enable the conductor to choose the prospective musically equipped members
 c. Will enable applicants to become self-conscious and afraid to join
 d. Will allow the conductor to make the applicants fee that the audition is not going to be easy
13. While conducting,
 a. Extend your arms for everybody to see
 b. Tap your foot for the rhythm
 c. Listen to the blend and balance and assist only when necessary
 d. Sing with the members from the beginning to the end
14. The voice comes put beautifully when,
 a. There is too much air
 b. The back of the tongue is arched
 c. There is correct throat and mouth opening.
 d. The chest is positioned relatively high
15. By asking the child being tested for possible membership in a choir, to imitate tonal interval
 a. The choir director can readily check his expressiveness
 b. The choir director can readily check his rhythmic accuracy
 c. The choir director can readily check his ear keenness to sound relation ships
 d. The choir director can readily check his ability to blend
16. These are notes which allow the singers to sing comfortably and beautifully
 a. Voice classification c. Range
 b. Tessitura d. Voice lift

17. Voice classification applied to a male choir member whose voice is still changing and has a more limited range.
- a. Tenor
 - b. Baritone
 - c. Bass
 - d. Cambiata
18. A point in which the voice changes its color, the voice shifts to another voice placement so that the singer will be able to sing the upper notes which might be beyond his range.
- a. Tessitura
 - b. Voice lift
 - c. Range
 - d. Cambiata
19. Good tone quality in singing is characterized by:
- a. Brilliance
 - b. Correct placement
 - c. Resonance
 - d. All of the above
20. The vocal mechanism that amplifies the tones and provides its characteristics timbre.
- a. Resonator
 - b. Vibrator
 - c. Actuator
 - d. Articulator

Asian Music

Prepared by:
Prof. Glinore S. Morales

Competencies:

1. Determine the characteristics of the music of various Asian countries
2. Identify and classify different instrumental medium of Asian music

PART I - CONTENT UPDATE

A. JAPAN

Traditional Music

- **Shomyo** – is called Buddhist chanting. The chants are based on sacred texts and hymns. They are sung acapella and are monophonic in texture.
- **Gagaku** – is court music, and the oldest traditional music in Japan. Gagaku music includes songs, dances and a mixture of other Asian music.
- **Noh** – Japan's first theater form. Its music became one of the most important genres of Japanese traditional music. It is employed in the same theatrical arts that has music, dance, poetry, design and costumes. The drama consists of singing known generally as yokyoku or utai.
- **Kabuki** – traditionally an all-male theater with a combination of melodrama and colorful dancing. It means “to act in an unusual manner wearing unusual costumes”. It was first written with three Chinese characters which meant “song-dance theater”.
- **Bunraku** – is a puppet theater. Its performance is sustained by three main elements: the art of the puppeteer himself, the words of the narrator or the singer, and the music of the shamisen player. The puppet is manipulated by three puppeteers.

Instruments**Aerophones or Wind Instruments**

SHO – a mouth organ that is made from bamboo or wood.

SHAKUHACHI – a bamboo flute with four holes.

FU'YE – a sophisticated side-blown flute with seven finger holes.

HICHIRIKI – an instrument similar to an oboe.

Chordophones or String Instruments

KOTO – a famous Japanese zither, with 13 silk strings, that is laid horizontally on the floor.

SHAMISEN – a flat-backed lute that has skin covered bellies and three strings.

BIWA – a Japanese version of the pi'pa that has four strings with frets on the belly and slim lateral tuning pegs.

Membranophone or Percussion Instruments (with membrane)

KAKKO – a gagaku instrument that is made up of deer skin.

DA-DAIKO – a huge gagaku drum suspended on an artistic frame and is struck with heavy lacquered beaters.

KOTSUZUMI – hourglass-shaped instrument used in noh and kabuki performances.

Idiophone or Percussion Instrument

SHOKO – gong instrument use by a performance of the gagaku-music

B. CHINA**Four Stages or Period**

- Formative Period** – music was used in folk festivals that are meant to give honor to the ancestors. Clay ocarinas and stone chimes were some of the instruments used to accompany these celebrations.
- International Period** – there was an overflow of musical ideas brought about by Western contacts and Asian trade.
- National Period** – the emphasis of this period was on vocal music, instrumental forms existed as well.
- World Music Period** – a new kind of music was born from the tradition of Western instruments and forms.

Chinese traditional music is based on the five tone scale or the pentatonic scale. It is written in duple meter in a single melodic line or in strophic form. In the northern Chinese folk music, the seven tone scale or the heptatonic scale is often used as a basis for compositions. Some Chinese compositions are written on the twelve tone (12) pitch scale called LU and the 60 pentatonic and eighty-four (84) heptatonic modes are called TIAO. Ideograms or symbols were used to notate Chinese Music.

Instruments**Aerophone or Wind Instruments**

HSIAO – an end blown flute with five finger holes, a reverse thumb hole and two resonating holes at the lower end

SONA – shawn like instrument with wooden stem with seven finger holes and reverse thumb hole

SHENG – a mouth organ with 17 bamboo pipes of five different lengths

Chordophone or String Instruments

CH'IN – a seven stringed long zither

P'IPA – a four stringed loquat-shaped lute

YUEH-CH'IN – a four stringed moon shaped lute used to accompany songs used in Peking Opera

ERH-HU – a two stringed fiddle played with a bowstring

SAN-HSIEN – a three stringed long necked lutes

Idiophone – Percussion Instruments

LO - circular gongs struck with a padded wooden mallet

MU-YU – hardwood slit-drum called “wooden fish”

TEMPLE CLAPPER – used in Confucian rituals, made of five pieces of redwood

Membranophone or Percussion Instruments (with membrane)

PANG-KU – two single headed drums made of wedges of wood held together with a brass hoop

TANG-KU – double headed barrel shaped drum with cowskin heads suspended by four rings from a curved frame

CHAN-KU – three double headed drums commonly used in processions

Peking Opera – is a musical art form, combines singing, heightened speech, mime, dancing, literature, theater and acrobatics. This opera traces its

roots from the ancient ritual dance, the Yuan and the Ming Romance. It is recognized and considered as a national art form. The basic characteristics of the Peking Opera are its simplicity, symbolism and synchronization. Most operas derive their plots from folklore, popular novel and historical events. This kind of opera upholds the Chinese traditional values which help educate the youth. The four dramatic elements are: recitation dialogue, song, theatrical adaptation of traditional Chinese martial arts combined with acrobatics and Pantomime.

C. INDIA

India, one the countries in South Asia, was colonized by the British but were able to retain their culture. For them, music is a sacred form of art. The study of Indian music begins with the religious chants called the Veda, composed by a tribe of nomadic shepherds. These hymns are sung without accompaniment. The art of Indian music has been called guided improvisation, which means that at all times, the musician must be guided simultaneously by the raga and the tala. There are two kinds of Indian music: Hindustani which belongs to the north and has a Moslem influence, and Karnatak which belongs to the south and is basically Hindu.

- Tala – is the metrical cycles of beats.
- Laya – is the tempo in Indian music. The laya may vary from fast (druta) to medium (maghya) or slow (vilambita).
- Matra – is the beat in Hindustani music and askhara in Carnatic music.
- Drone – is an important element in their music.
- Raga – is a combination of a scale and a melody. Each raga has its own mood such as happiness, sorrow, or peace. There are two principal tones of the raga: vadi and samvadi.

- Shruti – is the smallest interval tone in Indian music. In Western music, it is called microtones.
- Gamaka – ornamentation in Indian music.
- Sargam – is the Indian solfege syllables, they are equivalent to western solfege syllables.

Instruments

Membranophone or Percussion Instruments (with membrane)

TABLA – (Hindustani) is the name for a pair of drums. The larger drum called the bhaya, has a metal body while the smaller one, the tabla has a wooden body.

MRIDANGAM – (Karnatak) a two headed drum. It is laid across the lap of the performer.

Aerophone or Woodwind Instruments

BANSURI – a side blown cane flute is a melodic instrument of the Hindustani.

SHAHNAI – an oboe type instrument.

NAGASVARAM or NAGASVARA – a large double reed oboe type instrument of the South.

Chordophone or String Instruments

India has a variety of chordophones. In these instruments, three kinds of strings may be found: melodic strings, drone strings and symphatetic vibrators.

TAMBURA – unfretted lute, used as a drone; used by both South and North.

SITAR – the most popular instrument in Northern India; in addition to four strings and three drones, the sitar may have as many as 13 strings.

VINA – instrument of the South; with four melody strings and three drone strings.

SARANGI – Hindustani bowed fiddle melodic instrument.

D. INDONESIA

Indonesia shows varied cultural influences. Foremost of the influences still existing today are those of India and China which reached Indonesia in 300 B.C. Hinduism and Buddhism have greatly influenced Indonesian culture. Music, dance and drama are very important to the Indonesians.

- **Wayang Kulit** – (shadow puppetry) music and dance using puppets made of animal skin and painted with colorful designs.
- **Gamelan** – is the one of the most important musical ensembles in Indonesia. A Gamelan consists of metallophones, xylophones, drums, gongs and bamboo flutes. The arrangement of the instruments is important. The Gamelan is played in the courts. It plays an important part in spiritual life. It is used for religious ceremonies and important events. It is also a part of entertainment like the puppet show.
- **Pathets** – is the modes in music used to determine the highness and lowness of pitch. The three modes in slendro are the slendro pathet nem – lowest pitch, slendro pathet sanga – medium high and slendro pathet manyura – highest pitch. The three modes in pelog are the pelog pathet lima – lowest pitch, pelog pathet nem – medium high and pelog pathet barang

–highest pitch.

- **Slendro** - is the five tone scale or pentatonic scale.
- **Pelog** – is the seven tone system or diatonic scale.

The Gamelan Instruments

SARON – plays the skeletal part of the gamelan composition, which consists of metal bars placed on top of box resonator. A wooden mallet is used to strike the bars.

REBAB – is similar to the mandolin. It has two strings played with an arc.

CHELEMPUNG – has twenty-six strings, one pair of which is set to one tone. This way, only tones are heard.

SULING – is bamboo flute.

GENDER – is made up of thin bronze plates suspended over resonating tubes. It has loud and brilliant tones.

BONANG – is a set of bronze metal kettles which plays the melodic and rhythmic variations of a composition. Two long sticks are used to strike the gongs.

GONG AGENG – is the most sacred and the most honored instrument of the gamelan. It is played with a soft, padded wooden stick to mark large musical phrases.

GAMBANG – is wooden xylophone. It doubles or anticipates the principal melody.

KEMPUL – is a small gong that plays in syncopation with the kenong. It punctuates short musical phrases.

E. KOREA

Korean music may be described as elegant and very ritual like as the Chinese music. There is music for both the nobility and common people. Korean music is built on the pentatonic scale and on the heptatonic scale. Both scales are used in the Aak court music and during informal celebrations.

Traditional Music

- **Sog-ak** – is the music of the common people that is usually live. It portrays the life of ordinary people. It is folk music of Korea.
- **Chong – ak** – is the Korean Court music. The court music of the nobility is elegant, refined, delicate and formal. It is extremely slow and solemn, has subtle dynamics and possesses a sense of majesty.
- **Aak** – an imported form of Chinese ritual music.
- **Hyangak** – a pure Korean music.
- **Tangak** – a combination of Chinese and Korean influences.

Vocal Music

- **Kasa** – a long narrative song.
- **Kagok** – a lyrical song.
- **Sijo** – a short lyrical song.
- **Nong-ak** – song of the farmers.
- **P'ansori** – song for the stage and drama.
- **San-jo** – song for solo instrument.

- **Minjo** – a folk song sung in triple meter with one basic rhythmic pattern.

Instruments

Aerophones or Woodwind Instruments

P'IRI – is cylindrical bamboo similar to an oboe blown through a double reed mouthpiece.

TANSO – is a small notched vertical bamboo flute with five fingerholes.

CHOTDAE – is a long flute made of bamboo with six holes.

Chordophones or Stringed Instruments

KAYAGUM – is a twelve-stringed zither similar to the Koto of Japan and Ch'in of China. It is supported by twelve movable bridges.

KOMUNGO – is a six-stringed zither that plays as the principal instrument for a small group of players. It is regarded for expressing the noble spirit of a learned man.

HAEGUM – is a two-stringed fiddle made of bamboo that is plucked. It is used for dance performances.

Idiophones or Percussion Instruments

KWAENGGWARI – is the smallest gong struck with a wooden mallet.

PAK – is a clapper shaped like a folded fan. It consists of six pieces of wood loosely held together at the upper end by chord made from deer skin.

CHING – is a huge gong played with a padded mallet. This is used in military and Shaman music.

Membranophone or Percussion Instruments (with membrane)

CHANGGO – is an hour glass shaped drum played by striking either or both ends. The thick leather head produces a low sound while the thin leather gives a brighter tone sound.

F. THAILAND

The music of Thailand has been part of an oral culture and developed no traditional system of notation. Traditional Thai music is classified into: folk music, which is extensively used by people in the villages, and classical music, which evolved in many royal households and was used both for ceremonies and the entertainment of the ruling class.

Periods

- **In the Sukothai Period (1257-1378)** – there was great cultural development. The Thai alphabet was invented, and they enjoyed the music of strings, percussion, winds, drums, horn, trumpets, conch shells, bells and singing.
- **Ayuthaya Period (1350-1767)** – Thais enjoyed creating and performing music. It was during this time that the instrumental group first emerged. (pi - phat, khruang saay, mahori)
- **Krungthep Period (1782-1900)** – proved that the art was accorded high status with the patronage of the king. King Rama I invented new instruments which gave rise to the development of music and dance.

Three Types of Orchestra and Instruments

1. **Pi Phat** – this plays for court ceremonies and theatrical presentations.

Composed of woodwind and percussion instruments.

- a. PINAI – woodwind instrument
 - b. RANAT-EK – xylophone
 - c. KHONG-WONG – gong instrument
 - d. CHING – cymbal instrument
 - e. TAPHON – kind on drum instruments
2. **Khruang Saay** – ensemble of strings instruments composed of:
 - a. CHAKEE – zither
 - b. SAO-SAAM-SAA – fiddle
 - c. SAO DUANG – fiddle
 3. **Mahori** – accompanying solo and choral singing, mixes strings and percussion instruments like the following:
 - a. CHAKEE – zither
 - b. SAO-SAAM-SAA – fiddle
 - c. SAO-DUANG – fiddle
 - d. KLU-PIANG – flute

G. LATIN AMERICA

Latin America covers the whole Central and South America. It is called Latin because much it was conquered and colonized by Spain and Portugal, whose languages are based on Latin and are still spoken everywhere. The music of Latin America is a fascinating mix of the influences of the Spanish, Portuguese, British and French music, and by an influx of black African slave music.

The Latin Beat

- Tonadas (tunes or airs) are South American love songs in Spanish.

- **Habanera** – is perhaps the most stately and aristocratic Latin American rhythm which comes from Cuba, being named after its capital city of Havana.
- **Rumba and Mambo** – are much faster and clearly indicated by the spirit of African dance.
- **Tango** – probably originating in Argentina has a similar skipped beat.

Zamba and bossa nova of Brazil are more relaxed, evoking images of white sand, blue sea, and gently waving palms.

Latin American music joined hands with jazz to revolutionize the world of popular songs and dances.

Instruments

- **MARACAS** – were created and first used by the native Indians of Puerto Rico. A pair of these is used to create the unique sound common in Latin American and Puerto Rican music.
- **GUIRO** – a notched hollowed out gourd, which was adapted from a pre-Columbian instrument.
- **PALITOS** – a pair of sticks that are banged together to provide percussion rhythm.
- **CONGA** – this drum was adapted from Africa where it began as a solid, hollowed out log with a nailed-on skin. It took various shapes and sizes to vary its sound.
- **BONGOS** – are integral part of Latin percussion, particularly as a solo instrument.

H. AFRICAN MUSIC

In African traditions, music has been and still is an integral part of daily life, and is closely interlinked with the society in which and for which it is produced. It has social, ritual, ceremonial and at times recreational functions. Dancing is often an important part of the rituals and spiritual aspirations of music.

Traditional art forms, including music, are rooted in mythology and folklores, usually associated with gods, ancestors and legendary heroes. Musical activities are ritualized and intended to link the visible world with the invisible. Music is highly functional in ethnic life, accompanying birth, marriage, hunting and even political activities.

The Western scale patterns that relate most closely to African music are tetratonic, pentatonic, hexatonic or heptatonic arrangements.

Instruments

Drums are among the more popular instruments and are made in a variety of shapes and sizes. Materials such as wood, gourds and clay are used to construct drum bodies. Drum membranes are made from the skins of reptiles, cows, goats and other animals.

PART II – ANALYZING TEST ITEMS

1. It refers to a group of instruments which consists of saron, rebab, suling, chelempung, gender and bonang.
 - a. Rondalla
 - b. Gamelan
 - c. Orchestra
 - d. Ethnic Instruments
2. The Chinese traditional music is based from what scale?
 - a. Heptatonic scale
 - b. Hexatonic scale
 - c. Pentatonic scale
 - d. Nonatonic scale
3. The most stately and aristocratic Latin American rhythm which comes from Cuba, being named after its capital city of Havana.
 - a. Danza
 - b. Rumba
 - c. Habanera
 - d. Tango
4. Why does Japanese music not have regular rhythms and is generally not pleasant to our ears?
 - a. The Japanese focus on their music is to imitate the behavior of nature
 - b. The Japanese wanted to be unique in their music
 - c. The Japanese have their own music trained only for their ears unique for their flavor
 - d. The Japanese do not want their music to be influenced by other nations
5. A combination of Chinese and Korean influences.
 - a. Hyangak
 - b. Chong – ak
 - c. Tangak
 - d. A – ak
6. The combination of a scale and a melody in the music of India?
 - a. Raga
 - b. Shruti
 - c. Tala
 - d. Gamakas

7. This drama consists of singing known generally as yokyoku or utai.
 - a. Bunraku
 - b. Kabuki
 - c. Noh
 - d. Gagaku
8. The music is tetratonic, pentatonic, hexatonic or heptatonic arrangements, which country music is this?
 - a. Indonesia
 - b. India
 - c. Latin America
 - d. Africa
9. A kind of country music that joined hands or is fused with jazz to revolutionize the world of popular songs and dances.
 - a. Indonesia
 - b. India
 - c. Latin America
 - d. Africa
10. It is a Japanese Opera traditionally performed by male actors.
 - a. Kabuki
 - b. Peking Opera
 - c. Wayang Kulit
 - d. Gagaku
11. This group plays for court ceremonies and theatrical presentations. It is composed of woodwind and percussion instruments.
 - a. Pi Phat Ensemble
 - b. Mahori Ensemble
 - c. Khruang Saay Ensemble
 - d. Gamelan Ensemble
12. It is a musical art form that combines singing, heightened speech, mime, dancing, literature, theater and acrobatics.
 - a. Kabuki
 - b. Peking Opera
 - c. Wayang Kulit
 - d. Gagaku
13. Rumba and _____ are much faster and clearly indicated by the spirit of African dance.
 - a. Mambo
 - b. Zamba
 - c. Tango
 - d. Swing
14. Bossa Nova and _____ of Brazil are more relaxed, evoking images of white sand, blue sea, and gently waving palms.
 - a. Mambo
 - b. Zamba
 - c. Tango
 - d. Swing
15. It is a bamboo musical instrument native to Sundanese people of West Java. It is made out of bamboo tubes attached to a bamboo frame.
 - a. Angklung
 - b. Gamelan
 - c. Sasando
 - d. Kecapi suling
16. Which of the following is not true between pelog and slendro?
 - a. Both are used in the Indonesian Gamelan
 - b. Slendro is derived from the word saliendra
 - c. Pelog is the 5 tone scale
 - d. Slendro is the 7 tone scale
17. Which is correct in the following statements in Indian music?
 - a. Indian music divides the octave in to 12 semitones with 7 basic tones just like in western music
 - b. Hindustani music uses the similar Western "sofa" syllables in its scale
 - c. Indian music uses the SA,RI,GA,MA,PHA,DHA,NI syllables
 - d. Indian music is Polyphonic in nature
18. In what period did the khruang saay, pi phat, and mahori ensemble develop?
 - a. Krungtep period
 - b. Ayuthaya period
 - c. Sukothai period
 - d. Thai period
19. The puppet theater of Japan is called _____.
 - a. Kabuki
 - b. Noh
 - c. Bunraku
 - d. Gagaku
20. _____ is the pure Korean music.
 - a. Togaku
 - b. Komagaku
 - c. Hyangak
 - d. Tangak

PART III – ENHANCING TEST TAKING SKILLS

1. Which of Hindu musical instrument has 13 strings excluding the four melody and three drone strings normally played by plucking?

A. Vina	C. Tabla
B. Sita	D. Tambura
2. Which country in Asia has a rich and ancient civilization that began about 3000 B.C. with the settlement of the valleys along the Yangtze and Huang Ho Rivers?

A. India	C. China
b. Japan	D. Korea
3. While the Chinese used pentatonic scale, Indian Music is built on seven notes. What are the seven notes in their proper order?

A. MA, RI, SA, GA, NI, DHA, PHA	C. NI, PHA, DHA, SA, RI, GA, MA
B. SA, RI, GA, MA, PHA, DHA, NI	D. GA, MA, SA, RI, DHA, PHA, NI
4. What country was called the “Fishing Village” before the coming of the British?

A. Thailand	C. Korea
B. Latin America	D. China
5. Which is the call a long lyric song of Korea?

A. Kagok	C. Kasa
B. Shi-jo	D. P’ansori
6. How is a narrative song of Korea called

A. Kagok	C. Kasa
B. Shi-jo	D. P’ansori
7. The Indonesian five tone scale.

A. Pelog	C. Pathet
B. Slendro	D. Barang
8. The Indonesian seven tone scale.

A. Pelog	C. Pathet
B. Slendro	D. Barang
9. What is the largest island of the West Indies that lies to the South of the United States of the southernmost tip of the coast of Florida.

A. Spanish	C. Cuba
B. Latin America	D. Conga
10. Burung Kakak Tua is an Indonesian folksong which means _____.

A. Tree	C. Parrot
B. Bird	D. Fish
11. Hanabe No Uta is a song from _____.

A. India	C. China
B. Japan	D. Korea
12. What musical structure is contained in a Korean folksong “Arirang”?

A. Binary Form	C. Unitary Form
B. Ternary Form	D. Through-composed
13. La Cucaracha is a song from _____.

A. Africa	C. Mexico
B. Spain	D. America
14. What is the characteristic of the African music?

A. Solo singing	C. Chorus-like
B. Call and response singing	D. A capella singing

15. A carnival dance performed during the so called Comparsas or parades and its rhythm is essentially that of a march.
- | | |
|-------------|----------|
| A. Habanera | C. Salsa |
| B. Tango | D. Conga |
16. A musical play using puppets is called _____.
- | | |
|-----------------|------------------|
| A. Gamelan | C. Wayang Kulit |
| B. Peking Opera | D. Chinese Opera |
17. The Secular Music of China is called _____.
- | | |
|------------|----------|
| A. Ya-yueh | C. Chaio |
| B. Su-yueh | D. Ching |
18. What musical structure is contained in a Japanese folksong "Sakura"?
- | | |
|-----------------|---------------------|
| A. Binary Form | C. Unitary Form |
| D. Ternary Form | D. Through-composed |
19. The smallest interval tone in Indian music.
- | | |
|---------|-----------|
| A. Tala | C. Raga |
| B. Rasa | D. Shruti |
20. It refers to a metrical cycle of beats.
- | | |
|---------|-----------|
| A. Tala | C. Raga |
| B. Rasa | D. Shruti |

Philippine Music

Prepared by:
Prof. Glinore S. Morales

Competencies:

1. Chronicle Philippine music from pre-colonial times up to the contemporary period
2. Appreciate ethnic music
3. Identify colonial and foreign influences on Philippine Music.

PART I - CONTENT UPDATE

Philippine music consists of vocal and instrumental music from northern and southern part of the Philippines and divided into four eras or traditions, the Ethnic tradition, Spanish traditions, American traditions and Contemporary traditions. Philippine music revolves around cultural influence from the West due to Spanish and American rule. Ethnic music is still alive but mainly develops in highland and lowland barrios with little Western influence.

Ethnic Traditions

Philippine ethnic musical traditions are diverse in nature, although there are many common instruments and life-cycle functions. They differ mainly in form and structure, performance media, style, aesthetic, and theoretical properties (temperaments, scales, modes and terminologies).

Ethnic or Indigenous music may be instrumental or vocal. The following instruments divide according to Hornbostel-Sachs classification: idiophones, membranophones, aerophones and chordophones.

ETHNIC INSTRUMENTS			
Idiophone	Membranophone	Chordophone	Aerophone
North • Gangsa • Patatag • Bungkaka • Pattung • Ulibaw	North • Sulibao • Kimbal • Libbit • Ludag	North • Kolutong • Gitgit	North • Palendag • Tongali • Kaleleng • Saggeypo • Diwdiwas • Tambuli
South • Kulintang • Gandingan • Agung • Gabbang • Tagutok • Kubing • Babandil	South • Dabakan	South • Kudyapi • Kudlong	South • Paldong • Suling • Saunay • Plawta

Early Filipino Music

1. *Du-mu-ra* – is a love song with long verses.
2. *Tal-bun* – is a song sung on festive occasions or when there are visitors. This kind of song includes improvised words to suit the occasion.
3. *Pag-pag* – is a song composed of three notes and in two parts. The song is sung while pounding rice during wedding ceremonies.
4. *Ayoweng* – an industrial song consists of three notes and sung in social gatherings.

5. *Nan-a-an-to-o-ay* – is an Igorot funeral song of three notes and expresses grief over the death of one who died prematurely.
6. *Cañao* – is a ceremonious occasion with dancing, drinking of bubud or fermented rice, butchering of pigs and speeches.
7. *Sua-sua* – both song and courtship dance of Jolo.

- Classification of Songs

1. **Art Song** – is one that meets the requirements of the musical and poetic arts.
2. **Folk Song** – is a song of the people and consists of simple melodic, harmonic, and metric fundamentals.
3. **National Song** – is one that belongs to the nation. The national anthem or hymn, with a martial theme, is a national song.
4. **Popular Song** – is a song of trivial musical and poetic value, usually written by laymen for popular mass appeal. It is a song of the people.
5. **Strophic Song** – is a folk art or art song consisting of two or more stanzas, each of them set to an identical tune.
6. **Ballad** – is a class of song particularly common in England and derived from ballata, a song with dance.
7. **Plain Song** – is a piece of unisonous vocal music popularly used in Christian church rituals.

Traditional Melodies of the Filipinos

1. *Suliranin* – a sad monotonous song, pilgrims sing when the weather is hot.

2. **Indolanin** – a song, rustics sing in the streets when leaving or entering the town.
3. **Hila-Hila** – a dramatic song, sung when paddling a banca.
4. **Oyayi** – a kind of cradle song, sung to make babies go to sleep.
5. **Holohoo** – a song, sung to quiet down crying children or to pacify them when they are restless because of some ailment.
6. **Ombayi** – a song with funeral sentiment, sung by guests during interment or when one is sad.
7. **Sambotani** – a song, sung at a feast.
8. **Tagumpay** – a victory song to commemorate a battle won or to honor the victors.
9. **Tagulaylay** – a monotonous melody portraying grief over someone's death.
10. **Sambitan** – a funeral song performed by relatives of the deceased.

Spanish Tradition

Spanish colonial regime from 1565 to 1898 reshaped Philippine culture in general and Philippine music in particular. The songs on the exploits of epic heroes and the rhythms of the native drums and gongs started to fade before the chants of the Christian church and the harmonies of the organ, harp and guitar.

Liturgical Music originated as a part of religious ceremony and includes a number of traditions, both ancient and modern. The Spanish discovered that the Filipinos were singing people. In monasteries and churches, the first sounds of the Christian church that the “native” heard was the Gregorian chant or plainchant, unaccompanied monophony.

Extraliturgical Music – music developed outside the church and some of these are practiced by the entire major Christianized ethnolinguistic group. Some of the practices are: the Marian flores de mayo and santacruzan both held in May; the Easter salubong and bati and the Christmas panunuluyan.

Secular Music – is non-religious music.

Kumintang – an ancient native dance and melody of the Christian is an authentic example of pre-Spanish music in the Tagalog areas. Originally a war song, it was later adapted into a love song and still later into a song of repose.

Kundiman – a passionate lyrical song with a theme professing true love.

Balitaw – is song and dance common among Tagalogs and Visayans.

Habanera – named after its place of origin of Havana, Cuba, and also known as danza or danza habanera – is in duple time

Polka – dance in fast duple meter

Jota – originally a Spanish folk dance, has sections in duple and quadruple time

Numerous instrumental groups performed actively, particularly in the second half of the 19th century. These included orchestras, bands and rondalla.

American and Contemporary Traditions

The three centuries of Spanish musical influence gave way to changes introduced by the American regime from 1901 to 1946. Through the new system of public education, American teachers introduced the singing of Philippine songs in Western style as other hymns and simple tunes from Europe and America.

Types of music:

1. **classical music** – which includes both Western classical music and the art music composed by Filipinos in the Western classical or modern idiom.

- **western classical music** – influence of European classical music was made stronger by visits of individual foreign artists before and after the American occupation.

2. **semiclassical music** – which encompasses stylized folk songs, sarswela music, hymns and marches, band and rondalla music.

- **folk songs** – the field collection of folk songs undertaken in the 1920s and 1930s yielded substantial body of regional songs from the language groups all over the country. Initially transcribed in western notation, many of them were arranged for chorus and published as educational materials for the school system. These songs were later popularized in musical performances that called for native music, including folk dance presentation.

- **songs and ballads** – love songs and ballads have been composed and are still being composed in abundant numbers, catering to the everyday musical needs of a wide listening public.

- **music for theater** – early Philippine theater forms such as the komedya and the sarswela served as sources of light entertainment music.

- **instrumental music** – Philippine band music has become an integral part of the life of every Filipino in the lowland Christian communities.

3. **popular music** – which includes music created by Filipinos using Western pop forms and/or local music traditions.

- **popular entertainment** - the most significant influence of American culture on Philippine musical life is reflected in the popular music movement which catered to the need for entertainment and leisure by a growing mass audience.

- **pinoy pop music** – Filipino popular music, or Pinoy pop, covers a broad range of forms: folk songs, dance tunes, ballads, Broadway-inspired songs, rock'n'roll and its variants, disco, jazz fusion, and rap, that cater to a predominantly youthful audience in the urban centers and are disseminated widely through the electronic media.

Composers

1. **Nicanor Abelardo** – Father of Kundiman (Nasaan Ka Irog, Mutya ng Pasig, Bituing Marikit, Himutok and Kung Hindi Man)
2. **Julian Felipe** – Composer of National Anthem (Jose Palma – lyricist)
3. **Antonio Molina** – “Hatinggabi” – violin solo – impressionistic style, “Ang Batingaw,” Misa Antoniana Grand Festival March.”
4. **Dolores Paterno** – Composer of “La Flor De Manila 1897 (Sampaguita)”
5. **Lucio San Pedro** – 1991 National Artist (Sa Ugoy ng Duyan, Sa Mahal Kong Bayan and Sa Lupang Sarili)
6. **Francisco Santiago** – Composer of “Pilipinas Kong Mahal”, “Kundiman (Ako’y Anak ng Dalita)”, “Madaling Araw”, “Pakiusap”, “Ano Kaya ang Kapalaran” and “The Dignity of Labor.”
7. **Alfredo Buenaventura** – Conductor, teacher and composer of “Piano Concerto in C minor”, “Kayumanggi Symphony”, opera: “Maria Makiling”, “Alamat ng Pinya” and “Hinilawod.”

8. **George Canceso** – Composer of “Kapanatay ay Langit”, “Kailangan Kita”, “Ngayon at Kailanman”, “Kastilyong Buhangin” and “Gaano Kadalas ang Minsan.”
9. **Ryan Cayabyab** – Conductor, musical director, teacher and composer of “Isang Dipang Tao,” “Magandang Gabi sa Inyong Lahat,” “Kay Ganda ng Ating Musika,” and “Nais Ko.”
10. **Jose Mari Chan** – Singer and composer of “Christmas in Our Hearts,” “Beautiful Girl,” “Please Be Careful with My Heart,” and “Constant Change.”
11. **Willy Cruz** – “Araw-Araw, Gabi-Gabi,” “I’ll Never Ever Say Goodbye,” “Kung Mahawi Man ang Ulap” and “Pahiram ng Isang Umaga.”
12. **Ogie Alcasid** – Singer, songwriter, television presenter, comedian, parodist, actor, entrepreneur and composer of “Nandito Ako,” “Bakit Ngayon Ka Lang,” “Hanggang Ngayon,” “Pangako” and “Kung Mawawala.”
13. **Freddie Aguilar** – “Anak,” “Magdalena,” “ Bulag, Pipi at Bingi,” “Ipaglalaban Ko” and “Estudyante Blues.”
14. **AP0 Hiking Society** – Jim Paredes, Buboy Garrovillo and Danny Javier’s “Pumapatak ang Ulan,” “Salawikain,” “Mahirap Magmahal ng Syota ng Iba,” “American Junk,” and “Yakap sa Dilim.”
15. **Joey Ayala** – Singer, poet and composer of “Panganay ng Umaga,” “Mga Awit ng Tanod-lupa,” “Lumad sa Siyudad” and “Sa Bundok ng Apo.”

PART II – ANALYZING TEST ITEMS

1. La Flor de Manila or Sampaguita is the composition of _____.?
a. Julian Felipe
b. Jose Palma
c. Dolores Paterno
d. Atang dela Rama
2. Who are the Creative Nationalist Filipino Composer and the National Artist of 1991?
a. Restie Umali
b. Lucio San Pedro
c. Levi Celerio
d. George Canseco
3. The Impressionistic composer of Hatinggabi is _____.
a. Nicanor Abelardo
b. Lucio San Pedro
c. Antonio Molina
d. Francisco Santiago
4. Kung Hindi Man is an example of _____.?
a. Folksong
b. Balitaw
c. Kumintang
d. Kundiman
5. This is the period of the pabasa, pasyon and flores de mayo in the Philippines.
a. Ethnic period
b. Spanish period
c. American period
d. Japanese period
6. The "reyna" of Zarzuela is _____.
a. Sylvia La Torre
b. Conching Rosal
c. Dolores Paterno
d. Atang dela Rama
7. The "reyna" of Kundiman is _____.
a. Sylvia La Torre
b. Conching Rosal
c. Dolores Paterno
d. Atang dela Rama

8. It consists of 3 to 4 pieces of gongs with shallow bosses.
a. Agong c. Gandingan
b. Babandil d. Gangsa
9. From what region is the song Sarungbanggi?
a. Tagalog c. Visaya
b. Ilocano d. Bicol
10. Is a song and dance common among the Tagalogs and Visayans.
a. Kumintang c. Balitaw
b. Danza d. Habanera
11. From which region is the song Dandansoy?
a. Tagalog c. Visaya
b. Ilocano d. Bicol
12. The composer of "Pilipinas Kong Mahal" is _____?
a. Antonio Molina c. Lucio San Pedro
b. Nicanor Abelardo d. Francisco Santiago
13. "Sa Ugoy ng Duyan" is a composition by _____?
a. Antonio Molina c. Lucio San Pedro
b. Nicanor Abelardo d. Francisco Santiago
14. The most significant influence of American culture on Philippine musical life is reflected in the popular music movement which catered to the need for entertainment and leisure by a growing mass audience.
a. Popular entertainment c. Instrumental music
b. Pinoy pop music d. Music for Theater
15. Filipino popular music, or Pinoy pop, covers a broad range of forms.
a. Popular entertainment c. Instrumental music
b. Pinoy pop music d. Music for Theater
16. The song _____ is sung while pounding rice during wedding ceremonies.
a. Du-mu-ra c. Cañao
b. Pag-pag d. Tal-bun
17. _____ is a love song with long verses.
a. Du-mu-ra c. Cañao
b. Pag-pag d. Tal-bun
18. The gangsa instrument belongs to _____.
a. Idiophone c. Membranophone
b. Aeorophone d. Chordophone
19. The paldong instrument is classified as _____.
a. Idiophone c. Membranophone
b. Aerophone d. Chordophone
20. The best-selling Philippine music record of all time by Freddie Aguilar is _____?
a. Ipaglalaban ko c. Bulag, Pipi atBingi
b. Magdalena d. Anak

PART III – ENHANCING TEST TAKING SKILLS

1. The Ifugao ceremonious occasion with dancing, drinking of bubud or fermented rice, butchering of pigs and speeches is called _____.
 - a. Ayoweng
 - b. Sua-sua
 - c. Pagpag
 - d. Canao
2. The song and courtship dance of Jolo.
 - a. Ayoweng
 - b. Sua-sua
 - c. Papag
 - d. Canao
3. What do you call this ensemble that consists of kulintang, a set of eight small gongs of graduated sizes, dabakan, gandingan and babandil?
 - a. Saggong
 - b. Palabunyibunyan
 - c. Gangsa
 - d. Luntang
4. The instrument played by the Kalinga.
 - a. Saggong
 - b. Palabunyibunyan
 - c. Gangsa
 - d. Luntang
5. It is a song that belongs to a nation.
 - a. Ballad
 - b. Kumintang
 - c. Plainsong
 - d. National Song
6. Which of the following is not a category of Ethnic Philippine music?
 - a. Function – specific music
 - b. Music that maybe performed on similar occasion
 - c. Music performed at any time at any occasion
 - d. Music performed in churches.
7. The music includes both Western classical music and the art music composed by Filipinos in the Western classical or modern idiom is called _____.
 - a. Semiclassical music
 - b. Classical music
 - c. Popular music
 - d. Ethnic music
8. _____ music includes music created by the Filipinos using Western Pop forms and or local music traditions.
 - a. Semiclassical music
 - b. Classical music
 - c. Popular music
 - d. Ethnic music
9. Which of the following are to membranophone instruments?
 - a. Pattung
 - b. Babandil
 - c. Togo
 - d. Dabakan
10. Which of the following does not belong to chordophone instruments?
 - a. Saggeypo
 - b. Kudlong
 - c. Kolitong
 - d. Kudyapi
11. In general, it is the most influential contribution of the Spaniards to Philippine music.
 - a. The westernization of Philippine music
 - b. Christianization of music in almost all parts of the Philippines
 - c. Eradication of “devilish” cultural ethnic music
 - d. Education of Filipinos to music
12. Which of the following does not belong to the classification of songs?
 - a. Strophic song
 - b. Cañao
 - c. Folk song
 - d. Art song
13. Which of the following explains why there is an Extraliturgical music?
 - a. Because Filipinos wanted an independent liturgical music
 - b. Because of the musical aspect which conveyed much of Filipino's musicality

- c. Because of the great power of the Christian religion that its music extended beyond the walls of the church
d. It was a government project by the Spaniards to promote Filipino music
14. It is a regional variant of an awit which is in slow triple time and is referred to as a nationalistic song. It originated in Batangas.
a. Composo c. Kundiman
b. Kumintang d. Rigodon
15. The famous singer, song writer, television presenter, comedian actor and composer of the song "Kung Mawawala Ka" is _____.
a. APO Hiking Society c. Ogie Alcasid
b. Joey Ayala d. Willy Cruz
16. "American Junk" and "Yakap sa Dilim" are the famous songs by _____.
a. APO Hiking Society c. Ogie Alcasid
b. Joey Ayala d. Willy Cruz
17. It is a genre in the Contemporary era characterized by its mushy lyrics which are in Taglish and was important in the filipinization of Pop music
a. Manila Sound c. Pinoy Jazz Fusion
b. Pinoy Rock d. Pinoy Rap
18. If music stayed in the same western concept and idiom but is "filipinized" and "vernacularized" with Filipino concept, what genre can you categorize it know for the fusion of ethnic and contemporary?
a. Pinoy Jazz Fusion c. Contemporary
b. Ethnic Pop d. Popular Ethnic
19. She is known as the mother of Filipino classical music?
a. Eudenic Palaruan c. Eliseo Parajo
b. Lucrecia Kasilag d. Sylvia dela Torre
20. A song of trivial musical and poetic value, usually written by laymen for popular mass appeal.
a. National Song c. Plain Song
b. Ballad d. Popular Song

Western Music

Prepared by:
Prof. Glinore S. Morales

Competencies:

1. Chronicle the history of Western Music from the middle ages to the 20th century.
2. Analyze Western Music according to musical qualities

PART I - CONTENT UPDATE

A. MUSIC IN THE MIDDLE AGES (450-1450)

- **Gregorian chant** – consists of melody set to sacred Latin texts and sung without accompaniment. The chant is monophonic in texture. The melodies of Gregorian chant were meant to enhance specific parts of religious services.
- **The Church Modes** – consist of seven different tones and an eighth tone that duplicates the first an octave higher. The church modes were the basic scales of western music during the middle ages and Renaissance and were used in secular as well as sacred music.

Church modes consist of authentic (range of an octave above the finalis) and plagal (range of fifth above and fourth below the finalis).

Authentic

Dorian
Phrygian
Lydian
Mixolydian
Aeolian
Locrian
Ionian

Plagal

Hypodorian
Hypophrygian
Hypolydian
Hypomixolydian
Hypoaolian
Hypolocrian
Hypoionian

- **Secular Music in the Middle Ages** - music outside the church composed during the 12th and 13th centuries by French nobles called the trouba

dours and trouveres. The songs were usually performed by court minstrels, and most of them deal with love; but there are also songs about the Crusades, dance songs, and spinning songs.

- **The Development of Polyphony: Organum** – Medieval music that consists of Gregorian chant with one or more additional melodic lines. Between 900 and 1200 organum became truly polyphonic and the melody added to the chant became more independent.
- Composers:
 - a. **Hildegard of Bingen (1098-1179)** – composer of “O Successores” (You successors) was one of the most creative and many-sided personalities of the middle ages.
 - c. **Guillaume de Machaut (1300-1377)** - famous both as a musician and a poet.

B. MUSIC IN THE RENAISSANCE (1450-1600)

- **Characteristics of Renaissance Music:**
 1. The texture is polyphonic.
 2. Typical choral piece has four, five or six voice parts of nearly equal melodic interest.
 3. Imitation among the voices is common: each presents the same melodic idea in turn, as in a round.
 4. Homophonic texture, with successions of chords, is also used, especially in light music, like dances.

5. Renaissance music sounds fuller than medieval music.
 6. The bass register was used for the first time, expanding the pitch range to more than 4 octaves.
 7. Period of “golden age” of unaccompanied – a capella – choral music.
- **Sacred Music**
 1. **Motet** – is a polyphonic choral work set to sacred Latin text other than the ordinary of the mass.
 2. **Mass** – is a polyphonic choral composition made up of five sections: Kyrie, Gloria, Credo, Sanctus and Agnus Dei.
 3. **Secular Vocal Music: Madrigal** – a piece for several solo voices set to a short poem, usually about love. A madrigal like a motet, combines homophonic and polyphonic textures.
 4. **Secular Instrumental Music: Dance Forms** – the development of independent instrumental music grew out of two sources: the use of instruments to double or replace parts of a vocal composition and the use of instruments for dance music.

- Composers:
 - a. **Josquin Desprez (1440-1521)** – master of Renaissance music. Composed music for masses, motets and secular vocal pieces. “Ave Maria...virgo serena” is the outstanding choral work.
 - b. **Giovanni Pierluigi da Palestrina (1525-1594)** – devoted himself to Catholic Church music that includes 104 masses and some 450 other sacred works. “Pope Marcellus Mass” is the famous mass by Palestrina written for a capella choir of six voice parts: soprano, alto, two

tenors and two basses.

- c. **Thomas Weelkes (1575-1623)** – an organist and church composer.

C. MUSIC IN THE BAROQUE (1600-1750)

- Characteristics of Baroque Music:

1. Baroque pieces usually express one basic mood: what begins joyfully will remain joyful throughout
2. Rhythmic patterns heard at the beginning of a piece are repeated throughout it.
3. Baroque melody creates a feeling of continuity.
4. Paralleling continuity of rhythm and melody in baroque music is continuity of dynamic level: the volume tends to stay constant for a stretch of time.
5. Polyphonic in texture.
6. Chords became increasingly important during the baroque period.

- **Early Baroque (1600-1640) composers'** favored homophonic texture over the polyphonic texture typical of Renaissance music.

- **Middle Baroque (1640-1680)** – the church modes scales governed music for centuries gradually gave way to major and minor scales.

- **Late Baroque Period (1680-1750)** – many aspects of harmony – including an emphasis on the attraction of the dominant chord to the tonic – arose in this period. Instrumental music became as important as vocal music for the first time. Late baroque composers gloried in polyphony.

- Single Vocal Forms

1. **Recitative** – is a free form for solo voice with accompaniment in which the vocal melody approximates the natural rhythm and pitch inflection of the text.
2. **Aria** – is a song for solo and accompaniment in which the vocal part is written in a fairly complex style, often with several notes to each syllable of the text.
3. **Chorale** – sung in unison or in four-part block chord style.

- Multi-movement Vocal Forms

1. **Opera** – is a drama sung with instrumental accompaniment and presented with appropriate scenery, costumes and staging.
2. **Cantata** – is a composite vocal form in several movements for solo voice and instrumental accompaniment or for solo voices, chorus and instrumental accompaniment.
3. **Oratorio** – is a composite vocal work for soloists, chorus and orchestra based on a sacred or secular text.

- Single Movement Instrumental Forms

1. **Sectional Dance Form** – dances written in rounded binary form.
2. **Orchestral Overture** – an instrumental composition which serves as an introductory movement for an opera, oratorio or cantata or as the first movement of a composite instrumental piece.
3. **Fugue** – is a composition based on polyphonic imitative treatment of a short theme known as the subject.

- **Multi-Movement Instrumental Forms**

1. **Sonata da chiesa (Italian: church sonata)** – written for solo instruments
2. **Sonata da camera (Italian: chamber sonata)** – is a composite instrumental work based on dance forms.
3. **Suite** – an important Baroque instrumental form for solo harpsichord, clavichord or orchestral instruments. It is also a dance movement: allemande, courante, sarabande and gigue.

- **Composers:**

- a. **Johanne Sebastian Bach (1685-1750)** – German composer, organist, harpsichordist, violist and violinist whose sacred and secular works for choir, orchestra, and solo instruments drew together the strands of Baroque period and brought it to its ultimate maturity. Works: “Branderburg Concerto,” “Air on G-String,” “Toccat and Fugue in D minor,” “Organ Mass” and “The Magnificat.”
- b. **Claudio Monteverdi (1567-1643)** – one of the most important composers in early baroque era. Created the earliest operatic masterpiece “Orfeo”. The last opera by Monteverdi is “L’incoronazione di Poppea (The Coronation of Poppea).”
- c. **Henry Purcell (1659-1695)** – an English organist and Baroque composer of secular and sacred music. Works: “Dido and Aeneas,” “The Fairy Queen” (an adaptation of Shakespeare’s A Midsummer Night’s Dream), “King Arthur”, and “Jubilate Deo”.
- d. **Antonio Vivaldi (1678-1741)** – Italian composer, priest, and virtuoso violinist and known for composing instrumental concertos, especially

for the violin, as well as sacred choral works and over 40 operas. Works: “The Four Seasons,” “Twelve sonatas for two violins and basso continuo (opus 1),” “La Stravaganza for twelve violin concertos.”

- e. **George Frideric Handel (1685-1759)** – a master of Italian opera, English oratorios, anthems and organ concertos. Works: “Messiah,” “Water Music,” “Music for the Royal Fireworks,” “For unto Us a Child Is Born.”

D. MUSIC OF CLASSICAL PERIOD (1750-1820)

- **Characteristics of Classical Music:**

1. Emphasis on beauty, elegance and balance.
2. Homophonic Texture
3. Classical melodies are among the most tuneful and easiest to remember.
4. Sonata form was the most important design.
5. The orchestra increases in size and range. The harpsichord falls out of use. The woodwind becomes a self-contained section.

- **Single Movement Instrumental Forms**

1. **Binary Form** – form of movement with two principal themes or two distinct sections.
2. **Ternary Form** – form of movement with three principal themes or three sections.
3. **Rondo Form** – a typical pattern which letters representing thematic sections (ABACABA) there are five and seven part rondo forms.

4. **Variation Forms** – One of a set of series of transformations of a theme by means of harmonic, rhythmic, and melodic changes and embellishments.
 5. **Sonatina Form** – in essence, a miniature version of sonata-allegro form, but with shorter themes, an abbreviated or occasionally omitted development section, and a generally lighter character.
- **Multi-Movement Instrumental Forms**
 1. **Sonata Form** – refers to the form of a single movement and consists of three main sections: the exposition, where the themes are presented; the development, where themes are treated in new ways; and the recapitulation, where the themes return. The three main sections are often followed by a concluding section, the coda. These sections are all within one movement.
 2. **Concerto** – an extended composition for a solo instrument and orchestra, frequently in a sonata form.
 - **Single-Movement Vocal Forms**
 1. Recitative
 2. Aria
 3. Song
 4. Chorus
 - **Multi-Movement Vocal Forms**
 1. Opera – show significant advances in style and technique.
 - **Composers:**
 - a. **Wolfgang Amadeus Mozart (1756-1791)** – one of the most amazing

child prodigies, prolific and influential composer in the history of classical music. Works: “Eine Kleine Nachtmusik,” “Don Giovanni,” “Symphony No.40 in g minor,” “The Marriage of Figaro.”

- b. **Ludwig Van Beethoven (1770-1827)** – represents the highest level of musical genius. He opened new realms of musical expression and profoundly influenced composers throughout the 19th century. Works: “Symphony No. 5 in c minor,” “Piano Sonata in C minor Op.13,” “Moonlight Sonata.”
- c. **Franz Joseph Haydn (1732-1809)** – the first master of Viennese Classicism and the Father of Symphony. Works: “The Creation,” “The Seasons,” “Surprise Symphony,” “Trumpet Concerto in E Flat Major.”
- d. **Niccolo Paganini (1782-1840)** – composer, guitarist and virtuoso violinist. Works: “Caprice No. 24 in A minor,” “Tarantella,” “God Save the King.”

E. ROMANTIC PERIOD (1820-1900)

- Characteristics of Romantic Music:
 1. Describe as subjectivity, emotionalism, longing exuberance, imbalance, fantasy.
 2. Emphasis on self-expression and individuality of style.
 3. Expressive aims and subjects
 4. Nationalism and Exoticism
 5. Program music
 6. Expressive tone color
 7. Colorful harmony
 8. Expanded range of dynamics, pitch and tempo

- **Forms of Orchestral Music:**

1. **Program Symphony** – is a composition in several movements as its name implies, a symphony with a program. Usually, each movement has a descriptive title.
2. **Concert Overture** – has one movement, usually in sonata form. The romantic concert overture was modeled after the opera overture, a one movement composition that establishes the mood of an opera.
3. **Symphonic poem or tone poem** – is also in one movement. Symphonic poems take many traditional forms – sonata form, rondo, or theme and variations – as well as irregular forms.
4. **Incidental music** – is music to be performed before and during a play. It is “incidental” to the staged drama, but it sets the mood for certain scenes. Interludes, background music, marches, and dances are all incidental music.

- **Art Song** – a composition for solo voice and piano. Poetry and music are intimately fused in the art song.

- **Strophic Form** – repeating the same music for each stanza of the poem. Strophic form makes a song easy to remember and is used in almost all folk songs.

- **Through-Composed Form** – writing new music for each stanza. Through-composed form allows music to reflect a poem’s changing moods.

- **Song Cycle** – a cycle may be unified by a story line that runs through the poems or by musical ideas linking the songs.

- **Composers:**

- a. **Franz Schubert (1797-1828)** – earliest master of the romantic art song wrote some 600 lieder, nine symphonies, liturgical music, operas, some incidental music, and large body of chamber and solo piano music. Works: “Unfinished Symphony,” “Serenade,” “Symphony No.8 in B minor.”
- b. **Felix Mendelssohn (1809-1847)** – composer, pianist and conductor. Works: “A Midsummer Night’s Dream,” “Italian Symphony,” “Hebrides Overture.”
- c. **Frederic Chopin (1810-1849)** – composer, genius of the piano who created a unique romantic style of keyboard music. Works: “Nocturne in E flat Major,” “Etude in C minor,” “Polonaise in A flat Major.”
- d. **Peter Ilyich Tchaikovsky (1840-1893)** – was one of the most loved of Russian composers. His music is famous for its strong emotion, and his technical skill and strict work habits helped guarantee its lasting appeal. Works: “Nutcracker Suite,” “Romeo and Juliet,” “Sleeping Beauty,” “Swan Lake.”
- e. **Giuseppe Verdi (1813-1901)** – the most popular of all opera composers. Works: “Rigoletto,” “La Donna e Mobile,” “Aida,” “La Traviata.”

F. THE TWENTIETH CENTURY MUSIC AND BEYOND

- **Characteristics of 20th century music:**

1. Tone color became more important of music than ever before.
2. Many techniques considered uncommon before were being used during this time.

3. Many composers used noiselike and percussive instruments.
 4. Glissando, a rapid slide up or down the scales.
 5. Percussion instruments became a major part of 20th century music.
 6. Dissonant chords were becoming just as common as consonant chords.
 7. Many emphasized irregularity and unpredictability.
 8. The time signature would often change in the middle of piece.
- **Impressionism** – musical style that stresses tone color, atmosphere and fluidity, typical of Debussy.
 - **Expressionism** – musical style stressing intense, subjective emotion and harsh dissonance, typical of German and Austrian music of the early 20th century.
 - **Neoclassicism** – musical style marked by emotional restraint, balance and clarity, inspired by the forms and stylistic features of 18th century music.
 - **Nationalism** – Inclusion of folksongs, dances, legends, and other national material in a composition to associate it with the composer's homeland; characteristic of romantic music.
 - **Exoticism** – Use of melodies, rhythms, or instruments that suggest foreign lands; common in romantic music.
 - **Minimalist music** – is characterized by steady pulse, clear tonality, and insistent repetition of short melodic patterns; its dynamic level, texture, and harmony tend to stay constant for fairly long stretches of time, creating a trancelike or hypnotic effect.
- **Electronic instrument** – whose sound is produced, modified or amplified by electronic means.
 - **Free Jazz** – jazz style that departs from traditional jazz is not being based on regular forms and established chord patterns.
 - **Jazz** – music rooted in improvisation and characterized by syncopated rhythm, a steady beat, and distinctive tone colors and performance techniques. Jazz was developed in the United States predominantly by African American musicians and gained popularity in the early twentieth century.
 - **Jazz Rock (fusion)** – style that combines the jazz musician's improvisatory approach with rock rhythms and tone colors.
 - **Ragtime** – style of composed piano music, generally in duple meter with a moderate march tempo, in which the pianist's right hand plays a highly syncopated melody while the left hand maintains the beat with an "oom--pah" accompaniment.
 - **Popular Music** – belongs to any of a number of musical genres "having wide appeal" and is typically distributed to large audiences through the music industry. It stands in contrast to both art music and traditional music.
 - Composers:
 1. **Arnold Schoenberg (Austrian, 1874-1951)** – composer and theorist whose intransigent method of organizing music according to twelve equal notes profoundly influenced the direction of 20th century music. Works: "Pierrot Lunaire," "A Survivor from Warsaw,"

2. **Claude Debussy (French, 1862-1918)** – composer, originator of musical Impressionism. Works: “Clair de Lune,” “String Quartet in G minor,” “Nocturne,” “Fantaisie for piano and orchestra.”
3. **Bela Bartok (Hungarian, 1881-1945)** – a composer whose style was intimately welded to his pioneering folk music research. Work: “Concerto for Orchestra,” “Third Piano Concerto,” “Violin Concerto.”
4. **Sergei Rachmaninoff (Russian, 1873-1943)** – composer, pianist and conductor. Work: “Rhapsody on a Theme of Paganini,” “Prelude in C sharp minor,” “Symphonic Dances.”
5. **Aaron Copland (American, 1900-1990)** – greatly distinguished and exceptionally gifted composer. Work: “Appalachian Spring,” “The Cat and the Mouse for piano,” “Sonata in G major for piano.”
6. **John Cage (American, 1912-1992)** – writer, philosopher, and visual artist of the experimental school, who radically changed the course of 20th century music. Work: “Sonatas and Interludes,” “Dream,” “Water Music.”
7. **Miles Davis (American, 1926-1991)** – outstanding black American jazz trumpeter and bandleader. Work: “Miles Runs the Voodoo Dow,” “Miles Davis Quintet.”

PART II – ANALYZING TEST ITEMS

1. This music originates from the populace and is handed, spread, and passed orally. It has simple melody.
 - a. Folk music
 - b. Acoustic music
 - c. New age
 - d. Ethnic music
2. Which of the following styles of performing is used by Schoenberg in his composition “Pierrot Lunaire” where the lyrics of the song are half-sung and half-spoken?
 - a. Inversion
 - b. Rap
 - c. Sprechstimme
 - d. Retrograde
3. Who among the following personalities is a well-known impressions composer of the 20th century?
 - a. Bela Bartok
 - b. Arnold Schoenberg
 - c. Igor Stravinsky
 - d. Claude Debussy
4. Which of these compositions are not from the Classical era?
 - a. The Marriage of Figaro
 - b. Fur Elise
 - c. Symphonies Fantastique
 - d. Don Giovanni
5. It is a free form for solo voice with accompaniment in which the vocal melody approximates the natural rhythm and pitch inflection of the text.
 - a. Recitative
 - b. Chorale
 - c. Aria
 - d. Hymn
6. It is a song for solo and accompaniment in which the vocal part is written in a fairly complex style, often with several notes to each syllable of the text.
 - a. Recitative
 - b. Chorale
 - c. Aria
 - d. Hymn
7. Who is the composer of the “Branderburg Concerto”?
 - a. Wolfgang Amadeus Mozart
 - b. Ludwig Van Beethoven
 - c. Johanne Sebastian Bach
 - d. Franz Josef Haydn

8. It is the period of subjectivity, emotionalism, imbalance and fantasy.
 - a. Romantic
 - b. Contemporary
 - c. Classical
 - d. Baroque
9. It is a religious or sacred song, usually a metrical poem to be sung by a congregation.
 - a. Anthem
 - b. Hymn
 - c. Motet
 - d. Gregorian Chant
10. In which period in music history was the new tonal system invented characterized by the different kinds of ideology and music, the use of important technologies in producing sound and music and the widespread nationalistic spirit of music?
 - a. 16th century
 - b. 19th century
 - c. 18th century
 - d. 20th century
11. It is sung in unison or in four-part block chord style.
 - a. Chorale
 - b. Aria
 - c. Recitative
 - d. Oratorio
12. The United States most important contribution to the world of music which is improvised, syncopated, and with blues notes.
 - a. Opera
 - b. Jazz
 - c. Broadway musicale
 - d. Swing
13. His music was characterized as extroverted, grandiose and dramatic. Among his works are, The Messiah, Judas Macabeus, Water Music and Fireworks Music.
 - a. George Frederick Handel
 - b. William Byrd
 - c. Johann Sebastian Bach
 - d. Antonio Vivaldi
14. A dance of Polish origin, in $\frac{3}{4}$ time and moderate tempo; formerly in animated processional style, but now merely a slow promenade opening a ball.
 - a. Polonaise
 - b. Nocturne
 - c. Fantaisie Impromptu
 - d. Etude
15. Outstanding black American jazz trumpeter and bandleader.
 - a. Miles Davis
 - b. Aaron Copland
 - c. John Cage
 - d. Sergei Rachmaninoff
16. Text of the opera, oratorio and cantata.
 - a. Libretto
 - b. Score
 - c. Script
 - d. Book
17. A short coda.
 - a. Fine
 - b. Coda
 - c. Codetta
 - d. Dal Segno
18. The opening section of the sonata movement, in which the principal themes are presented for the first time.
 - a. Exposition
 - b. Development
 - c. Recapitulation
 - d. Fine
19. The working out or evolution of a theme by presenting it in varied melodic, harmonic, or rhythmic treatment.
 - a. Exposition
 - b. Development
 - c. Recapitulation
 - d. Fine
20. Which of the following best describes the characteristic of popular music?
 - a. Popular music may be the music of the hour as everyone else in community is singing it.
 - b. Popular music covers a wide genre composed of alternative, folk, acoustic, heavy metal, hip-hop, jazz, new age, rap, rhythm and blues and rock.
 - c. Popular music combines and regulates sounds of varying pitches to produce musical composition of varying emotions and ideas.
 - d. Popular music is promoted live and by print media.

PART III – ENHANCING TEST TAKING SKILLS

1. Period when the individual sought to revolt against established rules and traditions of previous eras. Composers sought to express their own creative identities.
A. Renaissance C. Pre-Baroque
B. Baroque D. Classical
2. Era of ecstasy and exuberance; of dynamic tensions and sweeping gestures; passion for large and noble objects.
A. Classical C. Contemporary
B. Romantic D. Modern
3. The foundation of Western Art was laid in this long period. Vocal polyphony was begun in which musical interest is sharp equally between parts which move independently to produce an interwoven texture. Notation of the sounds developed in this period: Syllable names for the note of the scale was invented by Guido d' Arezzo which is the basis of the modern Solfeggio system.
A. Renaissance C. Pre-Baroque
B. Baroque D. Classical
4. It's qualities are free and chance use of sounds, improvisation, processed music and sounds programmed into computers characterized by diverse methods and approaches to music.
A. Classical C. Contemporary
B. Romantic D. Modern
5. Their works feature such factor as terraced dynamic, bel canto and an incessant rhythmic drive. The major and minor modes gradually replacing the church modes and moderate modulation to related keys replacing the practice in remaining in one tonality.
A. Renaissance C. Pre-Baroque
B. Baroque D. Classical
6. Music was with no regular metric grouping, has narrow range, average tessitura and conjunct motion. Tonal organization is basically that of the church modes. Dynamics were not indicated in most music of this period. Texture was predominantly monophonic.
A. Renaissance C. Pre-Baroque
B. Baroque D. Classical
7. The period that gives impression of greater stability, repose, clarity, balance, objectivity and traditionalism where composers attempted to create music which is formal, strict in proportion and moderate in expression.
A. Classical C. Contemporary
B. Romantic D. Modern
8. The greater part of the music of this period is vocal and the formal element in this music is largely governed by considerations of the text. Much of the music is irregular in motive and phrase construction.
A. Renaissance C. Pre-Baroque
B. Baroque D. Classical
9. An extended composition for a solo instrument and orchestra, frequently in sonata form.
A. Concerto C. Fugue
B. Symphony D. Motet

10. An orchestral composition of from three or five distinct movements or divisions, each with its own themes and its own development.
 - A. Concerto
 - B. Symphony
 - C. Fugue
 - D. Motet
11. A sacred vocal composition in contrapuntal style, without accompaniment.
 - A. Concerto
 - B. Symphony
 - C. Fugue
 - D. Motet
12. A musical introduction to an opera or oratorio.
 - A. Overture
 - B. Intermezzo
 - C. Symphony
 - D. Interlude
13. An instrumental strain or passage connecting the lines or stanzas of a hymn.
 - A. Overture
 - B. Intermezzo
 - C. Symphony
 - D. Interlude
14. The famous composer, pianist and conductor who composed the famous "A Midsummer Night's Dream".
 - A. Peter Ilyich Tchaikovsky
 - B. Frederic Chopin
 - C. Felix Mendelssohn
 - D. Arnold Schoenberg
15. The composer militantly removed from the "Mighty Five" and the most popular composer under the Soviet regime. King of Russian Waltz.
 - A. Peter Ilyich Tchaikovsky
 - B. Frederic Chopin
 - C. Felix Mendelssohn
 - D. Arnold Schoenberg
16. The composer, genius of the piano who created a unique romantic style of keyboard music.
 - A. Peter Ilyich Tchaikovsky
 - B. Frederic Chopin
 - C. Felix Mendelssohn
 - D. Arnold Schoenberg
17. The composer and theorist whose intransigent method of organizing music according to twelve equal notes profoundly influenced the direction of 20th century music.
 - A. Peter Ilyich Tchaikovsky
 - B. Frederic Chopin
 - C. Felix Mendelssohn
 - D. Arnold Schoenberg
18. This music is characterized by steady pulse, clear tonality, and insistent repetition of short melodic patterns; its dynamic level, texture, and harmony tend to stay constant for fairly long stretches of time, creating a trancelike or hypnotic effect.
 - A. Minimalist Music
 - B. Free Jazz
 - C. Electronic Instrument
 - D. Jazz
19. The sound is produced, modified or amplified by electronic means.
 - A. Minimalist Music
 - B. Free Jazz
 - C. Electronic Instrument
 - D. Jazz
20. The style that departs from traditional jazz is not being based on regular forms and established chord patterns.
 - A. Minimalist Music
 - B. Free Jazz
 - C. Electronic Instrument
 - D. Jazz

Foundations of Physical Education

Prepared by:
Prof. Aquilino Eduardo P. Santos

Competencies:

1. Provide information about the nature, concepts, and objectives of physical education.
2. Identify the influences of the various philosophies on physical education.
3. Trace the historical development of physical education.
4. Identify the philosophical, psychological and sociological theories of physical education.
5. Apply the theories and principles in the teaching of physical education.
6. Relate the theories and principles to the teaching of physical education.

PART I - CONTENT UPDATE

THE NATURE, CONCEPTS AND OBJECTIVES OF PHYSICAL EDUCATION

For about a century, many people have been confused about the term physical education, and are not exactly sure about the term and what physical education teachers do. Even college students, who have chosen physical education as their major field shared this confusion. Despite this confusion, physical education has been accepted as part of the curriculum in all schools. What is important is that physical education is one subject that is well –taught and well-accepted.

Within the past decades, dramatic changes have occurred in the field of physical education and sport. Contemporary physical education and sport has expanded to include persons of all ages and abilities. Involvement in carefully designed programs can enhance the health and quality of life of the participants.

THE LEGALITY OF PHYSICAL EDUCATION

Article 1, International Charter of Physical Education and Sports, UNESCO, Paris, 1978 and Recommendation 1, International Disciplinary Regional Meeting of Experts on Physical Education, UNESCO, Brisbane, 1982 –

“The practice of physical education and sport is a fundamental right of all...”

“And this right should not be treated as different in principle from the right to adequate food, shelter, and medical care.”

Article XIV, Section 19, 1986 Constitution of the Republic of the Philippines –

“The state shall promote physical education and encourage sports programs, league competitions and amateur sports including training for international competition to foster self-discipline, teamwork, and excellence for the development of a healthy and alert citizenry.”

“All educational institutions shall undertake regular sports activities throughout the country and in cooperation with athletic clubs and other sectors.”

MEANING OF PHYSICAL EDUCATION

Many definitions of physical education have been given by authors and scholars in the field.

1. With new understanding of the nature of human beings in which wholeness of the individual is the outstanding fact, physical education becomes according to Jesse Feiring Williams (1977) “education through the physical”.
2. Stressing the total educational experience, John E. Nixon and Ann E. Jewett, as restated by William Freeman (1977) defined physical education as “that phase of total process of education which is concerned with the development and utilization of the individual’s movement potential and related responses, and with the stable behavior modifications in the individual which results from these responses”.
3. According to Robert P. Pangrazi (1998), “physical education is that phase of general educational program that contributes to the total growth and development of each child through movement experiences”.
4. Deborah Wuest and Charles Bucher (1999) defined physical education as “an educational process that uses physical activity as a means to help

individuals acquire skills, fitness, knowledge, and attitudes that contribute to their optimal development and well-being”.

The Allied Fields of Physical Education

The allied fields of physical education and sport share many common purposes – the development of the total individual and concern for quality life. These areas allied to the field may vary in content of the subject matter and the methods used in accomplishing their goals.

Health Education

Health education is concerned with the total well-being of the individual, which encompass physical, emotional, mental, social, and spiritual health. There are three areas within health education that are also functions and goals of health education.

- Health instruction is focused in teaching the basics of healthful living to students and the general public.
 - Delivery of health services is concerned with developing and maintaining a satisfactory level of health for all people.
 - Environmental health included within health education is concerned with the development of healthful and safe environments for all people.
- Recreation

Recreation is generally thought of as a leisure-time activity. However, it has been defined as fulfilling an educational goal of “worthy use of leisure”. It may be a self-chosen activity that provides a means of revitalizing and refreshing one’s body and spirit

Dance

Dance activities have been something of a stepchild for physical education, for

dance hangs on the periphery of physical education (Freeman, 1997). Aesthetic expression through movement is provided by dance.

THE OBJECTIVES OF PHYSICAL EDUCATION

The objectives of physical education pertain to all educational levels, although there could be delineation of goals for each level.

Physical Fitness Development Objective

The development of the various organic system of the body is necessary for an individual to have the ability to sustain adaptive efforts, to recover and to resist fatigue.

Motor Skill Development Objective

This objective is concerned with developing body awareness, making purposeful physical movement with a little expenditure of energy as possible, and being proficient, graceful, and aesthetic in this movement.

Cognitive Development Objectives

The cognitive development objective involves the accumulation of knowledge and the ability to think and interpret this knowledge.

Social-Emotional-Affective Development Objective

This is concerned with assisting an individual in making personal and group adjustments as well as adjustments as a member of society.

PHILOSOPHICAL FOUNDATION OF PHYSICAL EDUCATION

Philosophy, derived from the Greek word philisophia, means the love of wisdom. It can also be defined as a set of beliefs relating to a particular field.

BRANCHES OF PHILOSOPHY

BRANCH	FOCUS	General Questions	Questions Relative to Physical Education and Sport
Metaphysics	Nature of reality	What is the meaning of existence? What is real?	What experiences in a physical education program will better enable the individual to meet the challenges of the real world?
Epistemology	Nature of knowledge and methods of obtaining knowledge	What is true?	What is the validity of the knowledge pertaining to physical activity and its influence on the development of the individual?
Logic	Systematic and orderly reasoning	What is the method of reasoning that will lead to the truth?	What process should a researcher use to determine the value of physical education to program participants?
Axiology	Aims and values of society	How do we determine what has value, and on what criteria are this judgment based?	What is the value of physical education programs to the individual?
Ethics	Issues of conduct, right and wrong	What is the highest standard of behavior each person should strive to attain?	How can sport be utilized to develop ethics?
Aesthetics	Nature of beauty and art	What is beauty?	Why are skilled performer's movements beautiful to view?

TRADITIONAL EDUCATIONAL PHILOSOPHIES

Because of physical education's historic association with education, its program have been influenced by the five traditional educational philosophies-idealism, realism, naturalism, pragmatism, and existentialism.

Idealism

As a philosophy, idealism emphasizes the mind as central to understanding, reasoning plays a critical role in arriving at the truth, values and ideals are held in high regard and are considered universal and absolute, values and ideals don change regardless of circumstances. Intellectual development is emphasized and the teacher plays a pivotal role in the educational process.

Education under this philosophical approach emphasizes understanding of concepts and self-development.

As Applied to Physical Education and Sport

- Coaches promote development of character and the ideals of sportsmanship among the athletes over winning.
- Physical education professionals emphasize understanding of concept and self-development.
- Physical fitness and activities contribute to the development of one's personality.
- Ideals are emphasized in the physical education and sport programs.
- The activities should give students the opportunity to develop the qualities of honesty, courage, and creativity.
- Play is regarded as having recreational values, an opportunity for the child to be inventive, imaginative, and to express his feelings.

Realism

As a philosophy, realism emphasizes the use of the scientific method to arrive at the truth. Reasoning and understanding the natural laws of nature are features of this philosophy.

Education under this philosophy stresses the importance of training students in the scientific method, the use of proven methods, and following of orderly progressions, and periodic assessment of progress to ensure that learning is taking place.

As Applied to Physical Education and Sport

- Physical education focuses on the total development of the person.
- Physical educators carefully evaluate the scientific evidence in order to better understand the contribution of different types of physical activity to health.
- Physical educators incorporate frequent assessment procedures into their classes, so that the students would have a means to monitor their progress toward attainment of their goals.
- Coaches select training techniques based on the scientific evidence of their effectiveness, and would use systematic, progressive approach in designing practices.
- Programs are based on scientific knowledge and orderly progression, and activities are selected on the basis of scientific evidences.
- The emphasis on teaching is on fundamentals of games and activities with each skill broken down into its component parts.

Pragmatism

For a pragmatist, experience-not ideals or realities- are the basis of truth. Reality differs from person to person because individuals experience different situations.

Therefore, values are relative and are derived from one's experiences.

Within this philosophical approach, whatever works in a given situation at a given time is seen as successful, although pragmatists see the truth as variable and what is right as individually determined, they emphasize social responsibility. Individuals must recognize and fulfill their responsibilities to society.

Problem-solving, consideration of individuals' needs and interest, development of individuals' social skills, and cooperation are emphasized.

As Applied to Physical Education and Sport

- Variety of activities is presented for meaningful experiences.
- Activities are socializing in nature.
- Learning is accomplished through problem-solving method
- The curriculum should be based on the needs and interests of the students.

Naturalism

The belief that life is governed by the laws of nature is central to the philosophy of naturalism. Development of both the mind and body is incorporated in this philosophy.

It emphasizes the importance of considering each individual's level of growth and development in learning and designing experiences that are congruent to the individual's needs. The natural environment provides an excellent setting to help individuals learn. Self direction, individualized learning, and competition against oneself are important in this philosophical approach.

- The physical educator allows normal growth.
- Developmentally appropriate physical activities with the students at all levels of instruction are used..
- Physical educators emphasize individualized learning.

- Play and outdoor activities provide beneficial opportunities for exploration and problem solving as a means of personal growth and learning.
- Fitness leaders encourage their program's participants to take advantage of opportunities to engage in outdoor pursuits during their leisure time as a means of incorporating physical activities into their lifestyle.

Existentialism

According to this philosophy, reality is determined by individuals' experiences. Individuals must accept responsibility for themselves and the choices they make. An individual's experiences and choices create a uniquely personal worldview and affect their perception of reality. It emphasizes the freedom of individuals to think as they choose and to make choices, but stresses that they must accept the consequences of their actions.

Creativity, individuality, self-responsibility, and self-awareness are important aspects of this philosophy and learning experiences should reflect these attributes.

As Applied to Physical Education and Sport

- A sport psychologist encourages an athlete to carefully reflect upon his experiences in order to identify the thoughts that led to poor performances. He offers the athlete variety of options to deal with these issues, allowing the athlete to choose among the alternatives.
- A existentialist coach emphasizes the athlete's responsibility in adhering to the established code of conduct. He allows some individuality in dress, but emphasizes the athlete's responsibility in adhering to training rules.
- Physical educators allow students to select from a variety of activities with in the program, promoting reflection, and individual responsibility from learning.
- Physical educators emphasize the importance of creativity.

- The activities provide the students opportunities to develop self-awareness and self-responsibility.
- The teacher is a counselor who promotes reflective thinking while allowing the students to make choices, and deal responsibly with the consequences of those choices.

HISTORICAL DEVELOPMENT OF PHYSICAL EDUCATION

“By understanding the history of physical education and sport, a professional can better understand the nature of the profession, appreciate the significant developments from the past to the present, and project trends for the future” (Butcher and Wuest, 1995).

PHYSICAL ACTIVITIES IN THE PRIMITIVE SOCIETY

Participation in physical activities in the primitive society was practical. Strong, agile, and powerful body were necessary to carry on the demands of primitive life. Mimetic games provided children the opportunity to prepare themselves for adult life and responsibilities. Through dancing, primitive people communicated to their gods.

PHYSICAL EDUCATION IN ANCIENT NATION

Persia: Physical education was the modality used to accomplish the primary aim of developing in their young men military skills, high moral standards and patriotism to strengthen and extend the empire.

Egypt: Popular activities in ancient Egypt were swimming, since civilization's life

was based on rivers. Wrestling which was participated in by the nobility, the soldiers, the merchants, and the unskilled laborers; and gymnastic activities and games using the skills of fighting and war. Gymnastics exercises were required exercises to make the body supple, strong, and capable of great endurance and stamina. One of the most popular indoor activities was a board game called senet. Dances were both religious and folk.

China: Physical activities in ancient China were confined to the military men. They were given examinations on lifting the weights, shooting the bow, and handling the sword. They boxed, played football (tsu' u chu), and practiced jiu-jitsu. Recreational games and sports such as the early versions of soccer, polo, chess, and competitions in archery and wrestling, tug-of-war, water games, chi' ui wan (similar to golf), shuttlecock, and kite flying were popular. **Dancing** was popular that a man's prestige often depended on his prowess as a dancer. When ancient Chinese felt weak, **Cong Fu**, a mild exercises, similar to gymnastics-oriented calisthenics and developed in 2698 B.C was designed to prevent diseases and keep the body in good organic conditions.

India: Several physical activities were participated in by ancient India despite Buddha's prohibition of games, amusements, and exercises. Throwing balls, plowing contests, tumbling, chariot races, riding elephants and horse, swordsmanship, wrestling, and boxing were among their favorites. Became very popular in India was **Yoga**, which was a unique activity involving exercises in posture, regulated breathing, to discipline the mind and the body. Physical exercises were sometimes used to promote health. **Hindu dancing** was considered the oldest of organized dancing.

PHYSICAL EDUCATION AND SPORT IN GREECE

Physical education was a vital part of the education of every Greek boy. **Gymnastics** was believed to contribute to courage, discipline, and physical well-being.

It stressed a sense of fair play, development of the individual's aesthetic values, amateurism, and the utilitarian values inherent in the activity.

Greek sport manifested itself in the concept of the *amateur athlete*, whose primary goal is to compete in a "circuit" of four major national festivals- the *Olympia Festival*, the *Pythia Festival*, the *Nemea festival*, and the *Isthmia Festival* that were designated as the *Pan-Hellenic Festival*, and scheduled to ensure that one major competition was held every year.

The Spartan approach to physical training (not physical education) was strictly the training of the body for military purposes. The Spartan boy at seven years of age is housed in a primitive barracks under the watchful eye of the Paidonomous, who supervised the educational program called the Agoge. Instructions in swimming, running, fighting, wrestling, boxing, ball games, horsemanship, archery, discus and javelin throwing, field marches, and pancratiun, a combination of boxing and wrestling were given. At age twenty (20), he took an oath of allegiance to Sparta and went into actual combat where they engaged themselves in intensive military maneuvers and warfare until the age of fifty (50). A well-educated Spartan was one who was physically fit and a good soldier.

Spartan women at an early age were given physical activities such wrestling, swimming, and horseback riding to produce healthy babies when they marry.

In Athens, physical education and athletic competitions was prominent feature of Athenian education. Sport was associated with philosophy, music, literature, painting, and sculpture. Athenian youth at age six started his schooling in the palaestrae, which was commonly a center where wrestling activity occurred, and provided rooms for various physical activities and for oiling and sanding the athlete's body. Exercise and games were given by the physical education teacher called paidotribe, who owned the palaestrae. After deserting the palaestrae, the Athe-

nian youths attended the *gymnasium*, the physical, intellectual and social center of Greece, under a specialist called *gymnast*, who was responsible for training the youth in particular gymnastic contests. The gymnasiarch was the chief official at the gymnasium and an over-all in charge.

There were some Greek philosophers, teachers and medical men who contributed to the worth of physical education.

Plato believed that gymnastics and music, which were identified as "physical education" and "academics" respectively educates the body and the mind/soul. His argument in his Republic is that the mission of physical education in the schools blends with movements.

Aristotle believed that athletics enables youth to develop strong, healthy citizens who would defend Athens in time of war and serve her in time of peace.

Herodotus (Herodikos) used physical education as an aid to medicine as early as the 5th century.

Hippocrates proclaimed the law of use and disuse of the parts of the body. He believed that the parts of the body are strengthened through use. Muscle atrophy and weakness are results of disuse.

Xenophon thought of physical education as important in terms of military.

ROMAN PHYSICAL ACTIVITIES

Moral and military training were significant to the Romans. The *maintenance of health* was a worthwhile and natural goal for the Romans. These were evident in the proliferation of public baths with provisions for exercises – the **thermae**. Required physical skills among the Roman youths prior to their induction to manhood, and then into the military were held in the **Campus Martinus**, the replacement of the gymnasium after the conquest of Greece. Roman youth were given skills

in running, jumping, swimming, wrestling, horsemanship, boxing, fencing, archery, and instructions of complete obedience to commands. The Romans developed their own system of physical training and demanded the promotion of “*team unity*”. *Athleticism* of the Greeks was not valued militarily. *Spectacular gladiatorial combats* between slaves and prisoners were held at the Colosseum, the most famous landmark in Rome. Along with the **Colosseum**, horse and chariot races and large-scale entertainment were held at the *Circus Maximus*, the premier hippodrome in the Roman Empire.

Claudius Galen who developed a refutation in Alexandria to treat gladiators was one of the first to incorporate medicine and biomechanics into the science of exercise, and one of the first to practice sports medicine. He advocated vigorous exercises, which are performed with strength not speed, and violent exercises which combined strength and speed. He was opposed to the professional athlete.

Physical Education In The Middle Ages

An intriguing historical era shortly after the fall of the Western Roman Empire where the setbacks to learning, public works, and government associated with the invasions has been commonly termed as the *Middle Ages*. The Christian church (*Catholicism*), the only institution that survived the fall provided a symbol of stability and order amidst chaos and fear through intellectual and spiritual leadership. Two movements worked to its advantage – **asceticism** that had a belief in the existence of evil in the body and therefore it should be subordinated to the spirit, which is pure; and scholasticism, a highly intellectual philosophy that emphasized the mind. Monasteries were built where Christians could isolate themselves from the world and evils. Later, schools were attached to the monasteries and would not allow physical education to be part of the curriculum. Medieval university also frowned on physical education and sport. However, games and physical activities were still participated in by the people. Such were **soule**, a ball game that resembled the modern day soccer played by an indeterminate number of men on each side. **Kegels** was

similar to bowling. There were ball games that employed the use of sticks and were precursors to modern versions of hockey and baseball.

St. Thomas Aquinas, the greatest scholastic of all time, embraced the idea of physical fitness and recreation as a positive force in promoting social and moral well-being. Under the tutoring of Aquinas, Scholastics were able to cherish the body and value physical fitness and recreation for man’s physical, mental, social, and moral well-being.

Chivalry emerged as a kind of education that was physical, social, and military in nature. Three stages in the training for knighthood: as a Page – from age 7 to being a Squire – from age 14, and finally to being a Knight – at age 21. Knighthood was conferred after proving his fitness, bravery, skill, prowess, strength, and courage. *Joust or Medieval tournament* was the most famous of the war games where two mounted horsemen who would charge each other with long, wooden lances to knock down the opponent from his horse. *Melee* was an event in the tournament where groups of opposing knights would engage in hand-to-hand combat with dull swords.

Sons of noblemen had two careers to choose from: either they enter the monastery and become monks, or enter the knighthood.

Because wealth came from the labor of others, leisure became the unique commodity of nobles. Aristocrats had sporting activities. *Hunting and hawking* were other recreational pastime of the nobility. *Le jeu de paume* is a form of handball. *Royal tennis* was played within an enclosure. Sedentary forms of recreational outlets included shuffleboards, billiards, chess, and backgammon.

Physical Education In The Renaissance Period

With the emergence of the philosophy of *humanism* and its concepts of the

“universal man”, physical education became more valued. Good physical health was believed to promote learning. A person needed rest and recreation from study and work. The body is needed to be developed for purposes of health and for preparation for warfare.

There were some outstanding leaders during the Renaissance period who were responsible for spreading these beliefs concerning physical education and sport.

Petrus Paulus Vergerius’ physical education was preparation for the military, and his program included pentathlon, swimming, and horsemanship, the use of the shield, spear, sword and club.

Vittorio da Feltre’s school La Giocosa (Pleasant House) blended the spirit of Christianity, the classics, and the concepts of P.E. for the sons of the wealthy. He instituted P.E. as an important part of the educational curriculum.

Aeneas Silvio Piccolomini (Pope Pius II) believed that to prepare children to be good soldiers, the use of bow and sling, throw spear, ride horses, and swim in order to be a good soldier were necessary activities.

Martin Luther’s physical education was a means of obtaining elasticity of the body, and a medium of promoting health. He advocated music, games and dancing as acceptable pastime, and believed that people should engage in honorable and useful modes of exercises so they would not fall into vice and evil pursuits during leisure hours.

Thomas Elyot’s being familiar with the latest medical teachings of his time, he claimed six (6) physiological benefits that could be derived from exercise: aids in digestion, increases appetite, helps in living longer, warms the body, raises metabolism, and cleanses the body of its wastes.

Roger Ascham appreciated the value of exercise as a means of resting the mind to make it sharper at a later time.

Francois Rabelais believed that physical activities help the students reach his

goal of being a well-rounded individual and these include horsemanship, martial arts, hunting, and ball playing, running, and swimming.

Richard Mulcaster’s book *Positions* dealt specifically to physical education: for indoors, he recommended dancing, wrestling, fencing, and climbing; for outdoors, walking, running, leaping, swimming, riding, hunting, shooting, and playing ball. He was considered the “father” of the modern educational practice including sports in the schools.

Michel de Montaigne advocated “manly exercise” where the child experienced the rougher life in the outdoors.

John Comenius believed that exercise served as a rest from other parts of the learning process, and P.E. exists to refresh the body and able one to work and study more efficiently.

John Milton believed that martial arts should be practiced in schools, because they were useful in time of war.

John Locke believed that P.E. was of primary importance in developing an educational foundation because physical activity is used to refresh the individual in order to pursue more intellectual pursuits.

The development of the child’s health was **Jean Jacques Rousseau**’s first requirement in the education of the child. He believed that children should develop their senses through specific physical activities, such as swimming, running, jumping, spinning a top, throwing stones, etc.

Physical Education In Europe

Germany

Johann Bernhard Basedow founded the Philanthropinum in 1774, where three hours of the ten-hour school day was to be spent for recreational activities

such as fencing, riding, dancing, and music. His younger students engaged in “Greek Gymnastics” contests: running, wrestling, throwing, and jumping; older ones practiced “knightly exercises” as dancing, fencing, riding, vaulting on live horses, shuttlecock, tennis, skittles, and playing with large air-filled ball.

Johann Christoph Friedrich Gutsmuths who is considered the real founder of physical education, and “grandfather of physical education” legitimized the P.E. profession and believed in the promotion of people’s health to have a strong nation

Friedrich Wilhelm August Froebel established the theory of play and believed that play in the form of physical education was a wonderful mechanism for stress reduction, and character and moral development.

Friedrich Ludwig Jahn whose system of gymnastics was more political in nature established the German Turnverein Movement in the spring of 1811. He was called turnvater – father of gymnastics. The word was coined from the extinct Teutonic word – turnen – to perform gymnastics exercises.

Adolph Spiess believed that the P.E. program should be progressive that is, from simple exercises to more difficult. and advocated exercises combined with music for free expression, and believed in marching exercises as aid in class organization, discipline, and posture development.

Sweden

Per Henrik Ling was the founder of the Swedish medical and pedagogical gymnastics.

Lars Gabriel Branting devoted most of his time to the area of medical gymnastics where his teachings were based on the premise that activity causes changes not only in the muscular system of the body but also in the nervous and circulatory system

Hjalmar Fredrik Ling was credited for the organization of educational gymnastics.

Denmark

Danish program of gymnastics emphasized fitness and strength with formalized exercise performed on command and little individualized expression allowed. It used hanging ropes and ladders, poles for climbing, beams for balancing and wooden horses for vaulting.

Franz Nachteggall was acknowledged the father of physical education in Denmark. Due to his influence, P.E. became a requirement in both elementary and secondary public schools in Copenhagen. He established the Normalskol for Gymnastikken to emphasize the need to train P.E. teachers and provide instruction to students. He employed equipment such as hanging ladder, climbing poles, balance beam, vaulting horses, and rope ladder.

Niels Bukh’s “Primitive Gymnastics”, patterned to some extent after the work of Ling was one of the innovations in the field of physical education and sports.

Great Britain/ England

Swimming, rowing, archery, riding, hockey, quoits, tennis, golf, football (soccer), and cricket were played prior to 1800. Sports and recreation pursuits during this time were clearly among class lines or by economic status. Popular among the working class were sports that require little equipment like football (soccer) and boxing. Cricket and rugby were for the upper-class men. **Athletic sports** were a feature of English life. Football (soccer) is one of the oldest of English sports. **Hockey** and **quoits** were played in England as early as the 15th century, tennis as early as the 1300, golf as early as 1600, and **cricket** as early as 1700. As early as the time of Henry II, English youth did wrestling, throwing, riding, fishing, hunting, swimming, rowing, skating, and shooting the bow.

Archibald Maclaren who combined his knowledge of medicine, sports and

gymnastics to develop a system of gymnastics for the British army and navy was the chief contributor to England's physical education.

Physical Education In the United States

Sports, dance, and dramatic enactments were incorporated into native American festive celebrations. Physical prowess, cunning, skillfulness, skill, speed and endurance were valued. ***Baggataway (lacrosse)*** was popular and rituals often surrounded the game, also used to settle disputes. Rules and playing equipment vary by tribe. ***Shiny, a game similar to field hockey***, in which a stick is used to propel a ball into a goal was played by both men and women. ***Swimming, canoeing, archery, various types of ball games, and games of chance*** were other popular activities among the Native Americans. Horse racing was still popular apparently for the improvement of the breed. ***Bowling, tennis, cricket***, and early versions of the croquet and shooting matches were played and enjoyed.

The first horse race was a quarter mile long eventually gave birth to the ***Virginia Quarter Horse***. Southerners also enjoyed fox hunts, hunting, fishing, rowing, lawn bowling, dancing, cockfighting, boxing, and fencing. Southern gentlemen from proper families were expected to exhibit requisite social and athletic skills through riding, dancing, and fencing.

Tom Molyneux who was America's first well-known pugilist gained his freedom from slavery by fighting on the Southern Plantation Circuit.

National Period (1784-1861)

During this period, interest in education grew, and more schools were established. During the mid-1800s, gymnasiums and swimming pools were constructed. Turnvereins or German gymnastics societies were established. Horse racing and foot races were popular. The growth of female private schools increased educational

opportunities for women. In the 1820s and 1830s, physical education began to be incorporated into the school curriculum. German gymnastics was introduced during the 1820s. Baseball was invented in 1839.

Charles Beck, a Turner, introduced Jahn's gymnastic program of exercise and apparatus to his students at Round Hill School. He built an outdoor gymnasium and started the first school gymnastics program.

Charles Follen organized exercise classes based on the German system for students at Harvard University.

Catharine Beecher, the director of the Hartford Female Seminary for Women in Connecticut, an institution of higher education for young women, developed and implemented program of physical education within the educational curriculum of the school in 1828. It consisted of calisthenics performed to music. These exercises included Swedish gymnastics and were designed to improve the health and vitality of her students and to prepare them more fully for their future role as homemakers and mothers.

Civil War Period Until 1900

Dioclesan Lewis developed his system of "light" gymnastics in 1860. His program of gymnastics was directed at improving the health and well-being of his participants.

From 1870 to 1900, when the programs became much more focused and formalized and terms such as gymnastics, physical culture, physical training and physical education were used synonymously to describe the systematic exercise program. Physical education survived as the name became most closely identified with professional field and the academic discipline. Swedish gymnastics was recognized for inherent medical values. Tennis was introduced in 1874. Golf came to America in the late 1880. James Naismith invented basketball in 1895.

Dr. Dudley Allen Sargent became known for his work in teacher preparation, remedial equipment, exercise devices, college organization and administration, anthropometric measurement, and experimentation as basis for activity and scientific research.

Early 20th Century

In the early 20th century, **Jessie Bancroft** and **Elizabeth Burchenal** stressed the importance of intramural games rather than interscholastic competition for girls. Most institutions of higher learning provided some program of gymnastics for their students and sports, athletics and team games became more important.

Thomas Dennison Wood emphasized game and game skills and introduced his new program under the name “Natural Gymnastics”.

Clark Hetherington emphasized children’s play activities in terms of survival and continued participation, athletics and athletic skills.

Jessie H. Bancroft influenced the development of physical education as a responsibility of homeroom teachers in the elementary schools, and contributed much to the field of posture and body mechanics.

World War I (1916 to 1919)

- Many physical educators provided leadership for physical conditioning programs for the armed forces and for people on the home front.

Golden Twenties (1920 to 1929)

More games, sports, and free play became popular during this period. Measurement in physical education was emphasized as a means of grouping the students, measuring achievements, and motivating performance. Programs of physical education and sports continued to expand in schools and colleges. Elementary

school and secondary schools PE program stressed formal activities; periodic lectures on hygiene were added in the secondary schools.

Jesse Feiring Williams stressed the importance of physical education in general education

Thomas D. Wood, **Rosalind Cassidy**, and **Jesse Feiring Williams** published the book “*The New Physical Education*” in 1927.

Depression Years (1930 to 1939)

During the economic depression in the United States, health and physical education had a difficult time surviving in many communities. Physical educators became more involved in recreation programs in the agencies and projects concerned with unemployed persons. The trend in physical education was away from the formal-type approach to an informal game-sports approach. Intramural athletics continued to grow in colleges and universities. Women’s athletic associations increased in numbers.

Charles McCloy one the leaders of this time wrote the Philosophical Bases of Physical Education in 1940. He advocated “education of the physical” espousing the belief that school physical education’s unique contribution to the education of the individual is organic and psychomotor development. School physical education program, he said, should focus their efforts on promoting fitness and teaching sports skills.

Mid-Twentieth Century (1940 to 1970).

Boys and men, girls and women were exposed to the programs of physical education in American schools and colleges. Girls and women were provided opportunities to engage in competitive sports at both high school and college. **Lifetime**

sport was emphasized. **Research** became increasingly specialized in such areas as exercise physiology, motor learning, sociology of sport, and pedagogy. The fitness movement, the emphasis on preventive medicine, the increased specialization of the field, and the broadening of physical education and sport programs to reach all segments of the population are some significant developments in physical education and sport since 1970 up to the present.

PHYSICAL EDUCATION IN THE PHILIPPINES

Pre-Spanish Period

Physical activities were necessary for existence. Cockfighting, introduced by the Malays and considered a favorite sport was popular. Dancing was a religious activity with several purposes and officiated by a priest or a priestess. War dances were performed. Bathing and swimming were important part in the lives of the natives.

Spanish Period

Cockfighting continued to be a favorite sport and found its way to the other places in the archipelago. Dancing became a major activity enjoyed by the people. The Fandango, the Jota, the Curacha of Spain; the Polka, and Mazurka of Central Europe; and the Lanceros and Rigodon of France were introduced by the conquistadores to lure the Filipinos to be converted to Christianity. Ceremonial dances were performed during religious activities.

Recreational games such as the juego de anillo, juego de prenda, and the duplo (a poetic joust) were introduced. Girls played sungka, siklot, piko, luksong tinik, and hide and seek. Boys played patintero, sipa, and kite-flying. Older women played card games. Higher order recreational activities like horse races triggered the founding of Manila Jockey Club in 1867 to supervise the holding of races once

a year, but were closed down in 1880. In 1893, gymnastics was recorded to be a required subject for all candidates for the Elementary Teachers Certificate at the Superior Normal School for Men Teachers.

American Period

1901 – Physical exercise was one of the subjects introduced in the public schools, and regular program of athletics was developed.

1905 – Baseball and track and field were introduced and taught to young boys.

1909 – Athletic program for the schools emphasized the playing of western sports and coaching of tennis.

1910 – Basketball was first introduced as a game for young girls at the Carnival Meet held in Manila but was later discontinued in 1914 because it was found very strenuous for the girls. Later, indoor baseball, tennis, and volleyball were introduced.

1911 – The “Athletic Handbook” was published by the Bureau of Education where the first part prescribed few simple games and relays; the second part contained the rules for baseball, basketball for girls, volleyball, indoor baseball, track and field, and lawn tennis.

January, 1911 – the Philippine Amateur Athletic Federation (PAAF) was organized to control amateur sports in the Philippines.

1914 – In cognizant to the implementation of the “play for everybody” policy of the Bureau of Education, the Teacher’s Vacation Assembly started in Manila to give special training to Filipino teachers to be able to conduct various physical activities, and in turn recipients of the special training taught at the provincial normal schools.

March 5, 1919 – A syllabus entitled “Physical education: A Manual for Teachers” was published as a result of the plan in 1918 for a definite course of study in Physical Education, submitted by a special committee of superintendents.

- 1920 – Physical Education was made a required subject in all public schools. A rating of 75% which was based on attendance in the required exercises is necessary for promotion every year from grade four to fourth year high school. However, the grade was not included in the computation of the general average.
- 1928 – A Summer School for Coaching was opened by the Office of the National Physical Education Director in cooperation with the Bureau of Education to help the public school teachers who are in-charge of athletics to improve their coaching methods.
- 1937 – Physical Education was made a curricular subject in the secondary schools where the grade was not only based on attendance but in proficiency in skills as well. The grade was included in the computation of the general average.
- 1939 – Women's track and field was added in the program of the National Inter-Scholastics.

Japanese Period

The Japanese Military Administration obliged all public schools to perform daily calisthenics on air called the Radio Taiso, where Japanese instructors were provided. The demonstration of the exercise was held in Luneta.

Post-War to Present

1948 to 1952 – Under the joint sponsorship of the PAAF and Department of Education, The National College of Physical Education conducted a Summer school of Physical Education held at the Rizal Memorial Field. In 1953, PAAF took the sponsorship alone.

The Schools Physical education and Sports Act of 1969 provided program of activities that included among others a program of health education and nutrition, a program of physical fitness for all pupils, a program of competitive athletics, a program of intramural and inter-unit athletic competition within schools, districts, and provinces, and an annual competition within and among regions.

In the 70's and early 80's, physical education was incorporated in the subject Youth Development Training or YDT in the high school. The subjects included Physical Education, Scouting, Health, and Music.

The Physical education Program in the Elementary was revised in 1971 to comprise the activities such as the Testing Program, rhythmic activities, games, relays and athletic team games, swimming, and physical education for children needing attention.

The Revised Secondary School Program is contained in the Department Order No. 20, s. 1973. Two aspects of the program were Youth Development Training (YDT) for first year to third year and Citizen Army Training (CAT) for fourth year high school.

In MEC Order No. 6, s. 1982, the New Elementary School Curriculum (NESC) reflected directions for change based on the Program for Decentralized Educational Development (PRODED). PE in Grades I and II is integrated with the subject Sibika at Kultura (Civics and Culture) No specific time block is allotted to this subject but is taught as the need arises. Grades III to VI PE is clustered with Art and Music in a subject entitled Music, Art and Physical Education (MAPE).

The 1989 Secondary Education Development Program (SEDP) is a response to continue pupil development started by the Program for Decentralized Educational Development in 1982. Based on DECS Order No. 11, s. 1989, the New Secondary Education Curriculum (NSEC) of SEDP is cognitive-affective-manipulative-based

and is student-centered and community-oriented. One of the 8 subject areas in the NSEC is Physical Education, Health and Music (PEHM).

In the elementary, based on DECS Order No. 53, s. 1994, states that Physical Education in Grades I and II shall be listed as a separate additional subject and will be taught daily for 20 minutes beginning school year 1994 – 1995 in public elementary schools. It shall continue to be taught as a component of MAPE in Grades III to VI.

THE PHILIPPINE SPORTS COMMISSION

The Philippine Sports Commission (PSC) was created through Republic Act No. 6847 in 1990 to serve as the “sole policy-making and coordinating body of all amateur sports development programs and instructions in the Philippines”. It was mandated to provide the leadership, formulate the policies and set the priorities and directions of all national sports promotion and development, particularly giving emphasis on grassroots participation. Increased participation in sports by Filipinos (Grassroots Sports); excellence in sports performance by Filipinos (Elite Sports); and national unity and solidarity through physical fitness and sports are among its objectives.

THE PHILIPPINE OLYMPIC COMMITTEE

The Philippine Olympic Committee, the umbrella organization of all national sports associations (NSAs), is affiliated with the International Olympic Committee (IOC) and is recognized in the PSC Charter as the National Olympic Committee (NOC) for the Philippines. It is a private organization and autonomous in character, similar to its accredited and affiliated sports organizations. It is primarily responsible for activities pertaining to the country's participation in the Olympic Games, Asian

Games, Southeast Asian Games, and other international athletic competitions in accordance respectively with the rules of the International Olympic Committee, the Olympic Council of Asia, the Southeast Asian Games Federation, and other international sports bodies.

THE NATIONAL SPORTS ASSOCIATIONS

The National Sports Associations which are autonomous in character have exclusive technical control over the promotion and development of the particular sport for which they are organized. They decide on matters affecting the discipline of their athletes and officials and dispute among members; adopt a training program for athletes development, in preparation for international competitions; and select the athletes, coaches and other officials for their teams, taking into consideration not only their athletic abilities but their discipline, moral character, aptitude, and attitude.

Philippine Participation in the Olympics (1924 – 2000)

The Philippines was represented for the first time in the World Olympics. It was a two-man delegation sent by the Philippine Amateur Athletic Federation in the 1924 VIIIth Olympiad in Paris. David Nepomuceno, a Philippine scout competed in the 100 m. and 200 m. dash and was eliminated in the trial heats. Dr. Regino R. Ylanan was the representative official and coach.

The first medal (bronze) was garnered in the 1928 Amsterdam Olympics courtesy of Teofilo Yldefonso in 200 m backstroke. In the Los Angeles Olympiad in 1932 Teofilo Yldefonso won again a bronze in the same event. In addition, Simeon Toribio garnered a bronze in high jump and Jose Villanueva also bronze in boxing bantamweight. Miguel White brought the bronze in 400m hurdles in the 1936 Berlin Olympics, at the same time that the Philippine Basketball Team placed 5th place

among 23 nations. The first silver medal of the Philippines was won by Anthony Villanueva in boxing featherweight from Tokyo Olympics in 1964. In 1988 Seoul Olympiad, Arianne Cerdeña brought home the gold medal in bowling, which was a demonstration sport.

MEDALS and HONORS

Efren “Bata” Reyes was dubbed as “The magician”, when he became the 1985 Red 9-Ball Open champion for his ability to execute brilliant shots.

Eric Buhain was a bronze medalist in swimming in the 1990 Beijing Asian Games.

Eugene Torre became Asia’s first grandmaster at the age of 22.

Elma Muros was the only track athlete who won in different events in the Southeast Asian Games. She was hailed as the Southeast Asian games heptathlon queen in 1997.

Francisco Pancho Villa Guilleido was Asia’s first world champion in boxing and dubbed as the greatest flyweight of the century.

Gabriel “Flash” Elorde was dubbed as the greatest Filipino boxer of all time.

Gerald Rosales was an Asian Games silver medalist and Southeast Asian Games two-time champion in golf.

Jennifer Rosales was a five-time champion in golf in the ladies’ Amateur open (1994-1998) before she turned professional.

Lydia de Vega was Asia’s fastest woman in the 1980s. She brought home the gold medal twice in arrow in the Asian Games in the 100-meter dash and the silver medal in the 200m run.

Manny Pacquiao won the International Boxing Federation super bantamweight championship at the age of 23.

MikeeCojuangco-Jaworski is the accomplished equestrienne who bagged

the gold medal for the Individual Show jumping competition in the 2002 Asian Games.

Paeng Nepomuceno is an all-time greatest international bowler with six world championships to his credit; some considered him as the greatest Filipino athlete of all time for making it to the Guinness Book of World Records.

Ramon Fernandez was the Philippine Basketball Association’s first four-time Most Valuable player and played in the league for a record of 20 seasons.

Robert Jaworski was one the Philippine Basketball Association’s 25 greatest players of all time. At his time of retirement, he was the oldest professional basketball player in the world.

Toni Leviste was part of the Philippine Team that won silver medal in the 2002 Asian Games show jumping competition.

Alvin Patrimonio was a four-time Philippine Basketball Association Most valuable Player, two of which were won back-to-back in 1993 and 1994.

Bong Co made her mark in the bowling world when she delivered nine consecutive strikes in 1979.

Carlos Loyzaga led the Philippine Team that won bronze medal in the 1954 World Basketball Championship and four golds.

Dorothy Delasin is the Filipina who has become the youngest Ladies’ Professional Golf Association Champion in the last 25 years.

The Origin of the Olympic Games

The first recorded Olympic game was in 776 B.C. held at the foot of Mount Olympia in ancient Greece. The Games were held every 4 years. Although Greek cities had continuous wars, hostilities were suspended during the Games for 1 month and later extended to three months as they were sacred festivals in honor of Zeus. At first, it consisted only of one event called the **stade**, a 192 yard foot race. Korobus of Elis was recognized as the first champion. Only male citizens could compete

and watch the Games. Women were not allowed to observe and participate as athletes, except for the priestess Demeter, who observed the Games. Women caught observing the Olympic Games were taken to Mount Tympaion and thrown to their death. Other events were added thereafter. The Games were held for 1169 years until 393 A.D. Running and jumping events, discus and javelin throwing were held at the stadium. Horseback and chariot races were done in the hippodrome or race course. An open space in front of the altar of Zeus was the arena for boxing and wrestling. The games were abolished by Roman Emperor Theodosius in 394 AD in the belief that the games were pagan in nature.

THE MODERN OLYMPIC GAMES

In his quest to revitalize the youth of France, with his family being a well-to-do member of the French aristocracy, and an impeccable social and political connections the Frenchman **Baron Pierre de Ferd de Coubertin** established the modern Olympic Games.

Inaugural Olympic Games of the modern era was held in Athens, Greece in 1896. The goal of the Olympic Movement is to contribute toward achievement of mutual understandings and global peace by overcoming differences including race, nationality and culture through physical and mental disciplines. Its underlying concept is called **Olympism**, which is defined as a philosophy of life, the way of mankind within the Olympic charter.

Three Latin words “Citius, Altius, Fortius” meaning “Faster, Higher, Stronger” were adopted with permission as the Olympic Motto. The phrase was coined by Coubertin’s friend Father Didon during an IOC public conference held in a northern French town of Le Havre in the following year of inaugural Athens Olympiad. The **Olympic Flag** designed by Coubertin himself in 1914 was used in 1920 Antwerp Games in Belgium. Five colored rings from left to right in blue, yellow, black, green and red symbolizing unity of 5 continents of the world were set against a white

background which is symbolic of peace. It was also in this year that the Olympic oath was introduced. The Ceremonial Lighting of the Olympic Flame was introduced in 1928 during the Olympic Games in Amsterdam, Netherlands.. Women competed in athletic events for the first time. The first torch relay from Olympia to the host city was introduced in 1936 by Dr. Karl Diem, the director general of the Berlin Olympic Games.

THE ASIAN GAMES

The Asian Games are held for the purpose of developing intercultural knowledge and friendship within Asia. The member countries and regions affiliated to the Olympic Council of Asia participate in this multi-sports event. The Games are held every four years in between the Olympic Games. This was first conceived in 1950, and the first Asian Games were held in New Delhi, India in 1951 with its motto Ever Onward. The 2nd Asian Games was held in Manila in 1954. In 1994 Asian Games, despite opposition from other nations, OCA admitted the former Soviet Republics of Kazakhstan, Kyrgyzstan, Uzbekistan Turkmenistan, and Tajikistan.

THE SOUTHEAST ASIAN GAMES

The South East Asian Games were known as the South East Asian Peninsular Games until 1975. When SEAP Games Federation accepted Indonesia and the Philippines as members, the name was then changed to South East Asian (SEA) Games. Its aim is to promote cooperation, understanding and good relations among countries in the region. The first SEAP Games was held in Thailand in 1959. The hosting of the SEA Games is rotated alphabetically by nation name which removes the politics of bidding for the games, and allows the host countries ample time to plan for their turn at the games. Manila has hosted the 1981, 1991, and 2005 SEA Games.

THE ASEAN Para Games

The ASEAN Para Games is a biannual multi-event held after every Southeast Asian Games for athletes with physical disabilities. Patterned after the Paralympics, they include the mobility, disabilities, amputees, visual disabilities, and those with cerebral palsy. The Para Games is under the regulation of the ASEAN Para Sports Federation (APSF). The games are hosted by the same country where the SEA Games took place. The 1st ASEAN Para Games was held in Kuala Lumpur, Malaysia in 2001. To promote friendship and solidarity among persons with disabilities in the ASEAN region through sports; to promote and develop sports for the differently able; and to rehabilitate and integrate persons with disability into mainstream society through sports are the underlying objectives of the Games.

MOTOR BEHAVIOR

One of the primary concerns of physical education is the **learning and refinement of motor skills**. **Learning** is defined as a relatively permanent change in behavior and performance as a result of practice or experience. **Motor behavior** is concerned with the learning and acquisition of skills across the lifespan and encompasses three areas: **motor control**, **motor learning**, and **motor development**. Motor control and motor learning trace its roots to experimental psychology, while motor development traces its roots to developmental psychology.

- **Motor Learning** is the study of the acquisition of movement skills as a consequence of practice. Learning of a movement skill is inferred from performance. To assess how well an individual learned the skill, the instructor would observe the performance of the skill.
It focuses on studying the cognitive aspects of motor skill acquisition. The goals are “understanding the influence of feedback, practice, and indi-

vidual differences especially how they relate to the retention and transfer of motor skill”.

- **Motor Control** is the study of the neurophysiological and behavioral processes affecting the control of skilled movements. The goals are understanding “how the muscles and joints are coordinated during movement, how a sequence of movements is controlled, and how to use environmental information to plan and adjust movement”.
- **Motor development** is the study of the origins of and changes in movement behavior throughout lifespan. It involves understanding how motor behavior is influenced by the integration of psychological, sociological, cognitive, biological, and mechanical factors.

Learning Theories in Physical Education

The physical educator is concerned with facilitating learning in all three domains.

- **Cognitive Learning.** The concern of physical educators in teaching for cognitive learning is increasing the individual's knowledge, improving problem-solving abilities, clarifying, understanding, and developing and identifying concepts.
- **Affective Learning.** In teaching for affective learning, the physical educator is concerned with attitudes, appreciations, and values.
- **Psychomotor Learning.** This type of learning is the heart of the physical education and sport experience. The development of motor skill is the concern in teaching for psychomotor learning.

Stages of Learning

- **Cognitive Stage.** During this stage the learner is endeavoring to understand the nature and/or goal of the activity to be learned.
- **Associative Stage.** At this point the basics of the skill have been learned

and the learner concentrates on refining the skill.

- **Autonomous Stage.** This stage is reached after much practice. the learner can perform the skill consistently with few errors. The skill is well coordinated and may appear to be performed effortlessly.

Forces Influencing Learning

- **Readiness.** It is the successful acquisition of new information or skills depends on the individual's readiness. The desire and willingness to learn will affect his acquisition of that particular skill. Physiological readiness is the learner's readiness to control his body in physical activities to such a degree. Psychological readiness refers to the learner's state of mind; it is one's feeling or attitude toward learning a particular skill.
- **Level of Development.** As psychologist Piaget stated, "learning proceeds most rapidly when instructional experiences are geared to individual's physical and intellectual abilities.
- **Motivation.** It refers to a condition within an individual that initiates activity directed toward a goal. Needs and drives form the basic framework for motivation.
- **Reinforcement.** It is using events, actions, and behavior to increase the likelihood of a certain response (e.g., a skill or a behavior) recurring.
- **Individual differences.** In any learning situation, the physical educator must provide for individual differences – in social and economic backgrounds, physical abilities, intelligence and preferred learning styles, and personality.

Concepts, Factors, and Conditions that Promote the Learning of Motor Skills and improve Performance

1. Practice sessions should be structured.
2. The task to be learned must be understood by the learners.

3. The nature of the skill should be considered when designing practice.
4. Consider the learner in deciding whether to teach the skill by the whole or by part method, the nature of the task and the background of the learner.
5. Whether speed or accuracy should be emphasized in learning a skill depends on the requirement of the skill.
6. Transfer of learning can facilitate the learning of motor skills.
7. Essential for learning is feedback.
8. Plateaus (a period in which little or no progress is made) in performance may be experienced by the learners.
9. Self-analysis should be developed.
10. The leadership provided determines to a great degree how much learning will take place.

SOCIOLOGICAL FOUNDATIONS OF PHYSICAL EDUCATION AND SPORTS

SOCIOLOGY

Physical educators are interested in an important factor that motivates the formation of groups - the drive action that is inherent in a child. After becoming a member of a group, certain collections are important for successful adjustments.

1. **Need for affection** – the belief that he is liked by the other members
2. **Belongingness** – the belief that he is accepted
3. **Independence** – exemplifies the individual's right to make his own decisions.
4. **Social approval and Opportunity to Maintain Self-Esteem**

SOME THEORIES OF PLAY

1. **Surplus-Energy or Spencer Theory** expresses the idea of play as the aimless expenditure of exuberant energy. (Friedrich Schiller)

2. **Recreation Theory** emphasizes the recreative values of play, and play as a means of revitalization. (Guts Muths)
3. **Relaxation Theory** emphasizes play as a medium for relaxation in today's mode of work that leads to nervous disorders if the organism does not have a means to relax from the work's ordeal.
4. **Instinct Theory** declares that human beings have an instinctive tendency to be active at various stages of their life-time.
5. **Social-Expression Theory** by Bernard S. Manson expresses the modern theory of play. Physiological and anatomical structure of man as an active creature limits his activity. His degree of physical fitness at any time affects the kind of activity in which he engages in. The psychological inclinations that are the result of physiological needs and learned responses, habits, or attitudes propel him into certain types of play activities.

PLAY THEORISTS

- **Herbert Spencer** believed that play could be used to expend excess energy, which was necessary for survival.
- **G. Stanley Hall** viewed play and its natural extensions (games and sport) as ideal mechanisms of development, an ideal type of exercise for the young, most favorable for the growth, and most self-regulating.
- **John Dewey** believed that play was not a physical act that has no meaning, rather it was an activity the integrated mind and body.
- **Karl Groos** believed that play provides necessary experiences & prepares the individual for the coming tasks of life.
- **Luther Halsey Gulick** emphasized the benefits of play for the development of both the private (sense of self) and social aspects (social self) of the individual.

PART II – ANALYZING TEST ITEMS

1. When the physical education teacher assists a student in making personal and group adjustments as well as adjustments as a member of society, which of the following objectives does he want to attain?
 - a. Physical Fitness Development objective
 - b. Cognitive Development Objective
 - c. Motor Skills development objective
 - d. Social-Emotional-Affective Development Objective

The answer is option **d**, because option a (Physical Fitness Development Objective) assists students in the development of the various organic system of the body, while option b (Cognitive Development Objective) involves the accumulation of knowledge and the ability to think and interpret this knowledge, and option c (Motor skills Development Objective) is concerned with developing body awareness, making purposeful physical movement with a little expenditure of energy as possible.

2. Which of the following ally of physical education concerns itself on aesthetic expression through movements?
 - a. Sport
 - b. Health
 - c. Dance
 - d. Games
3. All of the following are attributes of the philosophy of existentialism that influence learning experiences in physical education, EXCEPT –
 - a. Competition
 - b. Creativity
 - c. Self-responsibility
 - d. Self-awareness

4. Self-direction and individualized learning are important in the teaching and learning process in physical education. These aspects are emphasized in this philosophical approach.
 - a. Idealism
 - b. Pragmatism
 - c. Realism
 - d. Naturalism
5. Although physical activities in the primitive society were practical in nature, primitive men still had to participate in recreational activities. Which of the following provided children in the primitive society preparation for adult responsibilities?
 - a. Dancing
 - b. Mimetic games
 - c. Physical exercise
 - d. Chanting
6. A strong Persian army meant a healthy and physically fit army. Persian physical education was _____.
 - a. The modality to lift weights, shoots the bow, and handles the sword.
 - b. Personified by iron discipline, obedient to authority, indifference to pain and suffering, and obsession to victory in battle.
 - c. The modality for brutal method of training the body for war which was a prestige profession.
 - d. The modality used to develop military skills, high moral standards, and patriotism.
7. Dancing was popular that a man's prestige depended on his prowess in it. This could be traced back from this ancient nation.
 - a. ancient China
 - b. ancient India
 - c. ancient Egypt
 - d. ancient Greece
8. Greek sport manifested itself in the concept of the amateur athlete, whose primary goal is to compete in a "circuit" of four major national games that were designated as the _____.
 - a. Capitoline Games
 - b. Heraean Games
 - c. Funeral Games
 - d. Pan-Hellenic Games
9. When was the first recorded Olympic Game that was held at the foot of Mt Olympus and had a single event, the stade, a 192-yrd foot race?
 - a. 476 A.D.
 - b. 394 A.D.
 - c. 776 B.C.
 - d. 724 B.C.
10. A Greek medical man who used physical education as an aid to medicine as early as the 5th century.
 - a. Herodotus
 - b. Hippocrates
 - c. Galen
 - d. Xenophon
11. Aside from the warriors, Rome grew into a nation of spectators. Spectacular and bloody gladiatorial combats became popular and were a favorite of the Romans. Where were these bloody spectacles held?
 - a. Circus Maximus
 - b. Campus Martinus
 - c. Colosseum
 - d. Thermae
12. This was a kind of education for the sons of the nobility that was physical, social, and military in nature that emerged after the fall of the Western Roman Empire.
 - a. Asceticism
 - b. Scholasticism
 - c. Feudalism
 - d. Chivalry
13. With the emergence of this philosophy and its concepts of the "universal man", physical education became more valued during the Renaissance period.
 - a. Realism
 - b. Existentialism
 - c. Monism
 - d. Humanism

14. "Understanding the influence of feedback, practice, and individual differences especially how they relate to the retention and transfer of motor skill" are goals of -
- Transfer of Learning
 - Motor Control
 - Motor development
 - Motor Learning
15. What important factor should physical educators be interested of that motivates the formation of groups?
- The belief that the child is liked by the other members
 - The belief that the child is accepted.
 - The drive action that is inherent in a child.
 - The child's self-esteem
16. This philosophical approach assesses dance performance in terms of graceful and expressive movements.
- Metaphysics
 - Linguistics
 - Aesthetics
 - Ethics
17. In teaching for psychomotor learning, the physical educator is concerned with -
- the acquisition of motor skills.
 - the understanding of concepts presented.
 - the instilling of qualities and values.
 - the realization of learning potentials.
18. During this stage of learning, the physical education teacher provides the learner to work on mastering the timing needed for the skill.
- Autonomous stage
 - Cognitive stage
 - Associative stage
 - Motor development
19. What is the concern of the physical educator in teaching for skill learning?
- The physical educator is concerned with attitudes, appreciations, and values toward physical activity.
 - The physical educators is concerned in increasing the individual's knowledge, improving problem-solving abilities, clarifying, understanding, and developing and identifying concepts.
 - The physical educator is concerned with motor learning and motor control.
 - The physical educator is concerned with the development of motor skills.
20. The physical education teacher grouped the students in his class and gave important task to be accomplished. One of his objectives is to give opportunity to each member of the group to make his own decision. This is opportunity for the students to -
- acquire the need for affection
 - feel the sense of belongingness
 - be independent
 - achieve social approval
21. Which of the following statement reflects a pragmatic teacher of physical education?
- Provides activities that give students the opportunity to develop the qualities of honesty, courage, creativity, and sportsmanship.
 - When the physical educator uses the problem-solving method in teaching an activity to effect learning.
 - Provides individualized learning through self-activity that leads to the attainment of individual goals.
 - Uses drills extensively after instructions.

22. All of the following statements are naturalistic view of physical education EXCEPT
- Developmentally appropriate physical activities at all levels of instruction are used.
 - Activities are socializing in nature
 - Physical educators emphasize individualized learning.
 - The physical educator allows normal growth.
23. This refers to a condition within an individual that initiates activity directed toward a goal. Needs and drives form its basic framework.
- Reinforcement
 - Motivation
 - Individual Differences
 - Readiness
24. It is using events, actions, and behaviors to increase the likelihood of a certain response.
- Reinforcement
 - Motivation
 - Level of Development
 - Independence
25. In any learning situation, what must the physical educator understand in terms of social and economic backgrounds, physical abilities, intelligence and preferred learning styles, and personality among students.
- Individual Differences
 - Cooperation
 - Need for Affection
 - Responsibility

PART III – ENHANCING TEST TAKING SKILLS

- The legal basis of physical education and sport is stipulated in what article and section of the 1986 Constitution?
 - Article XI, Section 19
 - Article XII, Section 19
 - Article XIII, Section 19
 - Article XIV, Section 19
- Motor skill development objective of Physical Education is concerned with—
 - The development of the various organic system of the body is necessary for an individual to have the ability to sustain adaptive efforts, to recover and to resist fatigue.
 - Developing body awareness, making purposeful physical movement with a little expenditure of energy as possible, and being proficient, graceful, and aesthetic in this movement.
 - The accumulation of knowledge and the ability to think and interpret this knowledge.
 - Assisting an individual in making personal and group adjustments as well as adjustments as a member of society.
- This philosophy influenced the teaching of physical education in terms of problem-solving, consideration of individuals' needs and interest, development of individuals' social skills, and cooperation.
 - Idealism
 - Realism
 - Naturalism
 - Pragmatism
- Understanding concepts and self-development in physical education is influenced by the philosophy of —
 - Idealism
 - Realism
 - Naturalism
 - Pragmatism
- He established the German Turnverein movement, where his members led the drive toward a unified democracy and social change in the German

states. He was then considered the father of physical education.

- a. Richard Mulcaster c. Friedrich Jahn
 - b. Johann Gutsmuths d. Franz Nachteggall
6. The Secondary Education Development Program (SEDP) is a response to continue pupil development started by the Program for Decentralized Educational Development in 1982., The New Secondary Education Curriculum (NSEC) of SEDP is cognitive-affective-manipulative-based and is student-centered and community-oriented. One of the 8 subject areas in the NSEC is Physical Education, Health and Music (PEHM). This is based on what order?
- a. DECS Order No. 11, s. 1989
 - b. Department Order No. 20 s. 1973
 - c. MEC Order No. 6 s. 1982
 - d. DECS Order No. 53 s. 1994
7. Romans believed that exercise was only for health and military purposes. All of the following had no value or had little appeal to the Romans, EXCEPT
- a. Greek formal athletic competition and training.
 - b. The Greek concept of health gymnastics.
 - c. Greek nudity and development of the body beautiful.
 - d. Athleticism
8. Greek sport manifested itself in the concept of the amateur athlete, whose primary goal is to compete in a "circuit" of four major national festivals that were designated as the Pan-Hellenic Festivals. What is the most popular among the four?
- a. Isthmia Festival c. Nemea Festival
 - b. Olympic Festival d. Pythia Festival
9. In the Philippines, this is autonomous in character have exclusive technical control over the promotion and development of the particular sport for

which they are organized.

- a. Philippine Olympic Committee c. National Sports Associations
 - d. SEAP Games Federation d. Olympic Council of Asia
10. The Romans developed their own system of physical training. They demanded the promotion of –
- a. athleticism c. individualism
 - d. team unity d. agon
11. The Philippines joined the 1924 Olympic Games in Paris for the first time. It was a two-man delegation sent by the Philippine Amateur Athletic Federation. Dr. Regino R. Ylanan was the representative official and coach. The athlete who was a Philippine scout and competed in the 100m. and 200 m. dash, but was eliminated in the trial heats .
- a. Teofilo Yldefonso c. Simeon Toribio
 - b. David Nepomuceno d. Jose Villanueva
12. She brought home the gold medals twice in a row in the Asian Games in the 100-meter dash and the silver medal in 200-meters. She earned the title Asia's fastest woman in the 1980s.
- a. Elma Muros c. Lydia de Vega
 - b. Bong Coe d. Jennifer Rosales
13. "What is the highest standard of behavior each person should strive to attain?" is a philosophical question that is emphasized in the teaching of physical education, especially in sport. This philosophical question pertains to –
- a. Axiology c. Aesthetics
 - b. Ethics d. Logic
14. Understanding how the muscles and joints are coordinated during movement, how a sequence of movements is controlled, and how to use envi-

- ronmental information to plan and adjust movement are goals of –
- Motor Development
 - Motor Skill
 - Motor learning
 - Motor Control
15. A theory developed by Guts Muths that emphasizes the recreative values of play, and play as a means of revitalization.
- Spencer theory
 - Instinct theory
 - Social-expression theory
 - Recreation theory
16. When coaches select training techniques based on the scientific evidence of their effectiveness, and would use systematic, progressive approach in designing practices, he is an advocate of the philosophy of –
- Idealism
 - Realism
 - Existentialism
 - Pragmatism
17. What does the physical education teacher consider in deciding whether to teach the skill by the whole or by part method.
- the task to be learned
 - the nature of the task and the background of the learner
 - the requirement of the skill
 - the plateaus
18. In teaching the folk dance, Mr. Redondo's concern is to develop a proper attitude towards folkdance, appreciation and values. These factors are attributed to –
- Cognitive learning
 - Psychomotor learning
 - Affective learning
 - Transfer of learning
19. Miss Demonstrador wanted to effect learning among her students most rapidly when she gave them instructional experiences that geared to individual's physical and intellectual abilities. This means that she believes in –
- Piaget
 - Freud
 - Schiller
 - Manson
20. A recreation leader emphasizes the benefits of play for the development of both the sense of self and social self of the students. With this in mind, he believes in –
- G. Stanley Hall
 - Herbert Spencer
 - Karl Groos
 - Luther Halsey Gulick
21. The philosophical question "What process should a researcher use to determine the value of physical education to program participants?" is related to the philosophy of –
- Axiology
 - Ethics
 - Epistemology
 - Logic
22. The physical education teacher uses this philosophical approach when he validates the knowledge pertaining to physical activity and its influence on the development of the individual.
- Axiology
 - Ethics
 - Epistemology
 - Logic
23. It is the study of the origins of and changes in movement behavior throughout lifespan.
- Motor Learning
 - Motor Development
 - Motor Control
 - Skill Learning
24. The desire and willingness to learn a particular skill will depend on this factor that influence learning.
- Readiness
 - Physical abilities
 - Level of Development
 - Reinforcement
25. He viewed play and its natural extensions (games and sport) as ideal mechanisms of development, an ideal type of exercise for the young, most favorable for the growth, and most self-regulating.
- Thomas Dennison Wood
 - Jacob Riis
 - Jessie Bancroft
 - G. Stanley Hall

International Folk Dance and Other Dance Forms

Prepared by:

Prof. Aquilino Eduardo P. Santos

Competencies:

1. Recognize folk dances from Asia, Europe and Latin America.
2. Trace the development of social dance along with traditional ballroom dance
3. Recognize other dance forms
4. Identify the modern ballroom dance
5. Identify international dance terms.
6. Analyze international dance steps.

PART I - CONTENT UPDATE

FOLK DANCE is a traditional recreational dance of an indigenous society showing the cultural characteristics of a specific people at a given time and place. It is the people's social expression through movements with rhythmic accompaniment where the characteristics of their community life are reflected. Moreover, the vivid, intimate bond of customs, ideals, culture and traditions of the past through which a multitude of national characteristics in music, steps and costumes are preserved. Developed spontaneously and naturally by a specific folk, it was handed down from one generation to another generation and followed a fixed pattern.

ASIAN DANCE

One authority declared that "The main idea of Oriental dance is found in the Japanese word asobi which means play, and comes from the idea of the play of the gods (Clarke and Crisp, 1980)". Religion and magic are major themes of most Asian dances.

The dances of Asia assert the importance of gravity. Feet may stamp or paw the ground, but contact with the earth is constant. The stylized use of the torso, head, and arms, the neck movements of Indian dance, the exquisite gesture of arms and fingers in Balinese dance, suggests a sophistication of style very different from the West. Originally, most theatrical dance forms were performed as part of religious worship or for entertainment. Asians have deep respect for tradition, which has encouraged dancers to make existing theatrical dance forms perfect rather than to create new styles. Slight movements of the upper body, facial expressions and hand gestures communicate the message of the dance. Every movement, even a raised eyebrow, may have significance.

Many dances describe through gestures a historical event, a legend, or a myth. A famous theatrical dance performance that takes place outdoors and last all nights which is held in Burma is called **pwe**. Spectators may shout out comments, tease the performers, and go backstage to watch them put on costumes and makeup.

Ancient Hindus believed that dance was given to them by the gods and goddesses. From the earliest times, dance has been important part of Indian life. **Bharata Natyam** is the oldest dance in the world that is still performed today. It is a dance originally performed in the temples of India, combines rhythmically complicated dancing with Hindu legends told in song and pantomime. Like other Indian dance forms, this temple dance uses **mudras** – hand gestures that have recognized meanings. Mudras often stand for animals, plants, or feelings. Indian classic dance contains three components – **natya** which represents the dramatic quality, **nritya**, the rhythmic aspect of the dance, and **nritya**, which has something to do with the expressive possibilities, the conveying of **rasa** (sentiment) and **bhava** (mood) through facial expression and bodily gestures.

China is not historically a nation in which dance was of any real importance. One of the rare indications about the earliest and uniquely Chinese dances has to do with the use of a long sleeve (known as the **“water sleeve”**) as a technical and expressive side to dance. It appears that the use of sleeves was part of shamanistic worship. Sleeve dancing was widespread in China. **CHINESE FAN DANCE** is a simple but interesting dance from China suitable for girls.

Korean dance reflects the historical and strategic importance of the country. The earliest clear record of it can be dated back to the third century. It was an essential factor of religious worship and of the nature cult that surrounded the planting and harvesting of crops. The point of departure that both North and South Korea in their conscious attempt to preserve and revivify the ancient traditions of the country's dance was the survival of dances which were performed as entertainments at banquets and dinners among the nobility and wealthy merchant classes. These

provided a basis for folk dances which have been carefully revived. Two elements are thereby protected: the ancient, traditional forms which include the surviving priestly dances, sometimes performed with a drum and folk dances which hark back inspiration to the work dances of peasants.

Japanese dance is more spiritual than technical. At its most intense, Japanese dance partakes of rituals and the performance of certain dances demands fasting and purification of the body in order to prepare the interpreter spiritually as well as physically. There are two basic styles of dance in Japan: the first embraces religious ritualistic dances, **the court dances** and the **dances of the Noh drama**, and the second is concerned with **Kabuki drama**, deriving from rustic dances and the popular dances of folk and festivals. Those elements which have been taken over from the severely beautiful and ancient Noh plays are called mai. The popular style taken from folk art is called **odori**. **Furi** are realistic mime movements and gestures which have been introduced from daily life. **BON DANCE** is a Japanese folk dance performed during the blooming of the Cherry Blossoms or during full moon. **JAPANESE PARASOL DANCE** is an easy, very colorful dance for girls. It is customary with the Japanese girls to use umbrella for rain or shine.

In Southeast Asia, **trance dances** blend superstitions with Buddhist, Hindu, and Islamic beliefs. During the **Barong**, a theatrical dance form performed on the Indonesian island of Bali, dancers in a trance act out a legendary battle between a dragon and a witch. The dancers turn knives on themselves. But in most cases, the trance prevents them from feeling pain and helps to protect them from injury.

The themes of Thai classical dance are religious traditional stories. A theatrical dance form exclusively for women is the **lakon**, whose libretti come from both legendary and historical and legendary sources. The purer dance forms are those relating to exercises performed by warriors.

In its ethnic tradition, Philippine dance is classified into three: **Ritual dances**

that connect the material world to the supernatural; *Life cycle dances* that celebrate birth, baptism, marriage, and death; and *Occupational dances* where life defenses and works are transformed into celebratory dances.

The coming of the Spaniards in the Philippines brought significant changes in the lives of the Filipinos especially in dance. Filipinos became Christians. The Spaniards introduced European dances that were easily adopted by the Filipinos. Such dances were Rigodon, Lanceros, Mazurka, Polka, Virginia, Valse and Havanera. However, there were still Filipino natives who have retained the traditional dances particularly those who were living in the Cordillera Mountains and High mountains of Mindanao aside from the Muslim Filipinos.

The most famous art of Indonesia include dances of the old royal courts of Java, and the dramatic folk dances of Bali. The Javanese dancers use slow, elaborate motions in which even finger movements have particular meaning. The dances represent scenes of adventure, battle, or love. Many Balinese dances are based on ancient Hindu stories, and have forceful rhythms and movements.

EUROPEAN FOLK DANCE

The folk dances of Europe are precise indication of the social characteristics of its folk songs and legends. They contain memories and references to religious or magical dances. The *ring dances*, the *maypole dances*, the *bonfire dances*, *sword dances*, *processional celebrations*, and *early religious dances* are usual traditions of folk dances throughout Europe.

- The *ring or round dance* was the most venerable and most widespread.
- In *maypole dances*, the totemistic nature of the pole itself involves both the idea of a symbol of divinity and of the fruitful and protective tree, the ribbons which habitually lined the dancers to the pole being understood as

the vestigial branches of the tree and the direct links joining the celebrants to the pole as a source of fertility.

- *Bonfire dances* are traces of the ancient worship of the sun.
- *Sword dances* pertain to almost as antique a tradition of martial art skill, simulated and sought through dance display, through imitative use of weapons which prepared warriors for combat and invoked success for them as well.

Responsible for the popularity of the folk dance, whether as couple dance or as group activity was the fertilization that occurred when in the seventeenth and eighteenth centuries, the country dances were adopted and codified by dancing masters. Folk dances have constantly fed the more formal social dances, irrespective of social class.

SOME EXAMPLES OF EUROPEAN FOLK DANCES

(Source: Aquino, Francisca R. *FOREIGN FOLK DANCES*. Manila, 1967.)

- **ARKADSKY** is a very lively dance for big men due to the characteristic gesture of the arms and the energetic steps inherent among Russian dancers.
- **BAVARIAN LANDLER** is a traditional dance of farmers in Alemania.
- **BARBARY BELL** is an old-fashioned country dance among the village people in England.
- **BLEKING** is a vigorous dance named after the province of Bleking in Sweden, where it is popular among the peasants.
- **CZARDAS** *Csarda* or *Czarda* means "village inn". The Czardas derived its name from the peasant dances performed outside the village inns. Gypsy musicians popularized the Czardas. These tunes and dances are divided into 2 parts: a slow stately part and a quick part called "frishka".
- **CSHEBOGAR** is a Hungarian "grief dance"

- **DANISH DANCE OF GREETINGS** is a simple dance showing the national traits of the Danish people – friendly, kind, and helpful.
- **DUTCH COUPLE DANCE** is a humorous dance of Holland depicting how the boy teasingly asks a bite from an apple.
- **HIGHLAND FLING** is a vigorous folk dance from Scotland especially adapted for boys.
- **IRISH LILT** is a very lively dance especially suitable for girls.
- **KALVELIS** is an occupational dance which means “little smith” where the clapping of the hands suggest the hammer and the anvil of the blacksmith.
- **LA PETITE UKRAINIENNE.** The peasant population of Ukraine, sometimes called “Little Russia” is very fond of dancing and this little dance gives a simplified version of the way they do it when fairs or festivals draw them together in merry-making.
- **NORWEGIAN MOUNTAIN MARCH** is a dance from Norway that depicts mountain climbing with the boy at the center as guide of the two girls behind him.
- **OYDA** is a dance which is a good example of round dances performed in the earlier centuries
- **PUTTJENTER** originated in the province of Westphalia, is a popular dance among the peasants of Germany.
- **RHEINLANDER FOR THREE** is a German couple dance that grown out of the youthful enthusiasm and creativeness of an east Prussian youth group.
- **SWEDISH CLAP DANCE** from Sweden is another example of a round dance in its polished form.
- **TROPANKA** is Bulgarian stamping dance.
- **VARSOVIENNE** is a German delightful dance for girls.

DANCE IN LATIN AMERICA

Dance in Latin America continues to play a major role in the religious ceremonies and community celebrations of the people. Indians and blacks developed it to accompany religious worship, to celebrate such events as birth and marriage, and to mourn the dead. It is also a highly popular form of recreation. Most Latin American countries have their own traditional dances that include steps from Spanish or Portuguese folk dances: the Spanish *zapateado* (heel beating steps) is part of the Cuenca of Bolivia and Chile; the *joropo* of Venezuela; and the *jarabe tapatio* or Mexican hat dance of Mexico.

In the West Indies, African and Spanish influences were combined in such ballroom dances as the *rumba*, and *cha-cha-cha*. The rumba, cha-cha-cha, and some other Latin American dances including the Argentine tango, Brazilian samba, and Cuban *Congo* are popular outside Latin America.

In the various regions of Mexico, there are dances which serve as reminders of hunting rites and religious beliefs. Among the surviving religious dances is that Concheros, who dance at fiestas, and in their performance the sacred impulse of the dances were evident.

- **Los Moros** is a relic of Spanish occupation, a dance usually given by four men, whose leader is identified as St. James.
- **Los Viejetos** (the little old men) is danced by young men who disguised themselves with masks and lean on sticks.
- **Los Inditos** (the little Indians) is a maypole dance. The dance performed in May is presided over by the “senior” (Our Lord) of Chalma, and offerings of eggs, necklaces, beads and flowers can be made after each dance.
- **LA COSTILLA** is a popular couple dance among the rancheros of Mexico. “Costilla” is an affection term used in Mexico for wives.

- **LA CUCARACHA** means the “little cockroach” is a dance known all over Mexico.
- **LA VIRGENCITA** which means “the little maiden” is a dance popular in Mexico.

SOCIAL DANCE

Nearly every society has social dances that are part of the culture. Each society has its own viewpoints about different aspects of social dance. In some societies, social dance is a group activity and is meant to be enjoyed by an individual in conjunction with other people. Some societies, social dancing is meant to be enjoyed by two people—a “couple”. Sometimes, social dance is seen as a completely individual activity. In some societies, there are strict rules that apply to social dance with regard to males and females dancing together, appropriate physical contact and dancing together.

Carole which involved song and simple dance steps was the perpetuation of the most ancient of the social dance forms. In its linked form in single file, it evolved into *Farandole*, in its circular form, the *Branle*, and became a couple dance in the South of France as *Estampie*, where the man and the woman hold hands and move forward side by side. The professional influence of the early Italian dancing masters and the social activity in the Italian courts impelled social dance forward to its remarkable path. The processional *Basse Danse*, known since 1400 as the Queen of Dances, and the *Pavanes* were formal and stately dances with gliding steps danced by couples. The group dance *Brando* was the counterpart of branle. With the desire to follow the quiet gliding dance estampie and the grave measured basse danse, the lighter and gayer dance *Saltarello* emerged. As always, the youth needed to be served, and a lively young people’s dance, the *Galliard* emerged as an after-dance to the slow peacocking dance of great dignity, the *Pavane*.

Other forms of dance emerged in the 16th and 17th centuries. The *Courante*, which was a pantomimic dance in origin suggesting courtship and with quite fast tempo, was especially popular. It had been codified in a much slower and graver form in France by the middle of the 17th century. The *Sarabande* which was originated in Spain where in the latter part of the 16th century it combined songs and dances thought of to be indecent and “repulsive” due to its physical frankness and unsuited to be performed by respectable people. The boisterous *La Volta* with lots of moving, turning, and high leaping steps in a closed embrace was considered bold, if not indecent.

Minuet, a lively dance in triple meter where small steps were essential part of the dance gained popularity during the time of King Louis XIV, the Sun King. Its development from a rustic dance into a dance of the gentry indicates its process of refinement. Despite its supremacy, another dance of peasant origin, the *Gavotte*, remained popular in the higher ranks of the society. It consisted of a mixtures of the movements of branles and galliards. Its introduction to court entertainments led to the establishment of a form that substituted dignity and stately grace for its original peasant vitality.

In the following centuries in Europe, when fashions changed, dances went with it. By 1588 the stately basse dance was outdated. Gavotte and minuet disappeared in 1789 when revolution swept away the court of France. When Europe’s ideas of freedom replaced ideals of courtly refinement despite the disapproving dancing masters, simple country steps grew more popular than the complex patterns of minuet. So-called *country dances* became fashionable at elegant city balls. These English country dances were later transformed into French contredanses, where the dance figures were grouped into a general title of *Cotillion*, which was in vogue in the 18th century. Its name was derived from the French cotte, which was a short petticoat worn by peasants. Descendant of the Cotillion was the *Quadrille*, a square dance that emerged during the Napoleonic years in France at about 1740.

Rapid changes in dancing styles occurred in the 19th century. The minuet disappeared, and by 1850, except for the Sir Roger de Coverley or *Virginia Reel*, contredanse was also gone. *French Quadrille* which combined contredanses and cotillions became extremely popular. The *waltz*, which owes its name from the Latin *volvere* – to turn, was introduced to fashionable ballrooms in the early 19th century and became the most popular of all the new dances. This close-couple dance with its close hold was at first received with considerable dismay. It was derived from Austria's landler. By 1790 Vienna waltz was all the rage in German town. Schubert, Chopin, Strauss helped to spread the fame of waltz tunes. By 1825, it had come to stay. By the 19th century, it has to face its rivals. The *Gallop* was possibly the simplest dance ever introduced into the ballroom. The *Mazurka*, originally a Polish round dance conquered both public balls and theatrical dance. The United states created the *Boston*, Central Europe, the *Polka*, originally from Bohemia and which was introduced in Paris in 1840 was feverishly welcomed as a fashionable ballroom dance of tremendous energy, Hungary, the *czardas*, the Italian *tarantella*, Russia's *gopak*, and Spain's *flamenco*. Europe's newly discovered folk dances inspired gay waltzes, mazurkas, polkas. These filled the 19th century New York, Paris, and London ballrooms.

America in the 19th century was to turn to the ballroom dance as an expression of polite social ambition. This is when the country was to shift from agricultural to industrial identity. **VIRGINIA REEL** is a traditional American dance. It is the ancestor of the square dance popular during the colonial days in America. European social dance forms were adopted. Waltz was accepted in 1830. Polka swept America. However by the latter years of the century, an authentic American dance emerged, the *Military Schottische* or *Barn Dance*, a simple and ebullient dance with foot stamps and slightly refined in manner. The term "barn dance" was derived from the tune "Dancing in the Barn" when schottische was first danced to its tune. **OH SUSANA** is an American round dance mixer and it is used as a prerequisite to square dancing. **RED RIVER VALLEY** is an American dance traditionally performed with one boy at the middle and two girls in each set of three. The dancers sing aloud as they perform the dance.

By the early 20th century, two-step, one step foxtrot, and tango were introduced. Quadrilles, lancers, and other open-couple dances had essentially disappeared, and the usual ballroom dance program consisted entirely of the accepted closed-couple dances. John Philip Sousa, the King of March produced many popular marches. The Boston Two-Step, which is basically a marching step with interpolated skips, became popular. One Step, which followed the Boston *two-step*, was the most popular of the dances. Inspired by the ragtime music, it required performers to dance *one step* to a beat.

In 1900, the jerky Negro rhythms of the *Cakewalk* challenge the smoothly gliding waltz. Dances derived from "savage" Africa swamp the dance halls of the Western world. This began when West African slaves, shipped to North America, brought with them tribal songs and dances. When the slaves gained freedom, Negroes performed native music and dances in New Orleans' Congo Square.

When Negro musicians borrowed Irish, Scottish, Italian, French, and Spanish tunes, they mingled them with Negro rhythms and improvised jazz melodies. Negro rhythms, soon popular with white musicians, changed the white dances. Western social dancing had changed to keep pace with the changing Western world. As life's tempo speeded up, the Cakewalk, Bunny Hug, Grizzly Bear, Black Bottom gave young Westerners the thrills they sought and failed to find in waltz or polka.

The story of social dance is a story of movement and space. Always as they move, dances take with them something of the land they come from. In Negro-inspired jive and jitterbug, bebop, rock n' roll, city teenagers have found what they wanted.

In 1910, *Tango* arrived from Argentina. Its origin can be traced to a slave dance in Cuba, and by no means respectable. It was introduced into Europe at the beginning of the 20th century, and in France, where it was transformed into a more polite form. In 1912 Argentina's tango gained fame in Paris within a year. Mid-century

rock n' roll swept first in the United States, then Europe, in mere months. *Modern mambo*, *rumba*, and *jive* represent changing fashion in social dance. *Foxtrot* which was originated by a comedian, Harry Fox, who worked in the Ziegfeld Folies, emerged in 1914. But as early as 1913, he had introduced some quick trotting steps into a dance to ragtime music in his act. By 1914, it became a popular dance form.

The most vital impulse to social ballroom dancing in the 20th century was the emergence of *Jazz* from New Orleans. It became synonymous with freedom, good times, and an abandonment of many of the social attitudes and taboos after World War I. One dance that epitomized the freedom and wildness of the 1920s was *Charleston*. *Swing* or *boogie-woogie* and *lindy* or widely, jitterbug superseded the jazz rhythm in the 1930s. Jitterbugging was an American pastime at the New York World's Fair in 1939. The dance provided a release from wartime pressures. The basic technique of the so-called "a new form of sexual display typified by the gigolo image of the sultry Southern male – the *Rumba*, which was accepted by the public in 1930. For the first time in centuries, dancers abandoned the physical contact when the Twist, which went to the other extreme, was the next craze. It was a very simple dance that amounted to little more pelvic gyrations "as if drying your back with a towel" accompanying a foot movement that resembled the treading of a cigarette-end into the ground. *Samba* is dance of Brazil. *Paso Doble*, with its imitation of the bull fight stems from Spain but was refined for the ballroom in the Southern region in France, The man represents the matador, the lady his cape. *Cha Cha Cha* is a descendant of the *Cuban Mambo*.

Youth oriented form of music and dance exemplified by rock n' roll was introduced to delighted teenagers by the film *Rock Around the Clock* made in 1956. With this birth of rock n' roll, social dance styles became freer. Partners did not touch each other, and they made their own dance movements.

During the 1960s and 1970s, blacks created many dances that the whites enthusiastically adopted. In 1960, Chubby Checker recorded "The Twist", and a new dance craze emerged. Other dances such as the "monkey", "mashed potato", and the "frug" became popular with both black and white teenagers. A popular style of dancing in the 1970s called "*disco*" rejected the "*do-it-yourself*" choreography of earlier rock dances. Instead, dancing partners held each other and followed a set pattern of steps.

During the 1980s, young black males popularized *break dancing*, which consisted largely of acrobatic movements performed to rock music. "Slam" dancing was another dance craze that was popularized in the early 1980's, where dancers literally slammed into each other. Rap music which was developed in the 1970s, but became popular in the late 1980s as a voice for inner-city minority groups, came a new, popular form of dance known as "*hip-hop*" - also known as "street dancing". It combines several movements from African and jazz dance vocabularies with newly created movements.

Many people today, as in years past, enjoy social dancing. Many people dance to release frustrations and negative energies and many people dance for the sheer fun of it. Whatever the reason people dance, the culture and society of the time to which they belong will certainly be reflected in the movements, style and music that make up the dance.

OTHER DANCE FORMS

BALLET

Ballet can be traced to Italy during the 1400's at the time of the Renaissance. *Catherine de Medici*, a member of the ruling family of Florence, became the queen

of France in 1547. She introduced into the French court the same kind of entertainment that she had known in Italy. They were staged by Balthazar de Beaujoyeulx, a gifted musician who had come from Italy to be Catherine's chief musician. Beaujoyeulx created in 1573 ***Ballet des Polonais***, a court entertainment performed by sixteen women who each represented one of the French provinces. He went on to create. ***Ballet Comique de la Reine*** in 1581 commissioned by de Medici. The spectacle lasted from 10:00 a.m. to 3:30 p.m. The ballet told the ancient Greek myth of Circe, who had the magical power to turn men into beasts. The ballet included specially written instrumental music, singing, and spoken verses as well as dancing. Dance technique was extremely limited, and so Beaujoyeulx depended on spectacular costumes and scenery to impress the audience. Printed copies of the verses used in the ballet were distributed so that the audience is sure to understand the story. The ballet was a great success. Ballet Comique de la Reine established Paris as the capital of the ballet world. King Louis XIV who ruled France during the late 1600's and early 1700's strengthened that leadership. The king enjoyed dancing, and he took part in all the ballets given at his court. The court ballets were performed by and for members of the nobility. King Louis XIV founded the Royal Academy of Dancing to train professional dancers to perform for him and his court. Professional ballets began in the king's dancing academy.

In 1900s, ballet took on a new look, philosophy and aesthetic, which is referred to as "**classical**" ballet. Classical ballet can be traced back in Russia when a choreographer named **Marius Petipa** began to create ballets. Several characteristics and features are always found – performed on a proscenium stage, spectacular scenery fills the upstage and side areas of the stage, dancers are always dressed in elaborate costumes typical of the character they are portraying- all of which enhance the storyline of the ballet, which is usually a fairy-tale or fable. ***Sleeping Beauty*** was choreographed in 1890 by Petipa and first performed in Russia. ***Swan Lake*** was choreographed by Petipa and Lev Ivanov in 1895.

Contemporary ballet evolved in Russia in the early to mid 1900s due mainly to the work of a choreographer named **Michel Fokine**. It is similar to classical ballet. The striking difference between the two is that contemporary ballet lacks storyline or plot. It is usually concerned with movement as the primary focus. It rejected the use of pantomime and literal gestures and abstracted the movements that appeared within the dance. **George Balanchine**, Russian choreographer who defected to America in 1933 was one of ballet's greatest innovators and is considered by many to be the greatest contemporary ballet choreographer. He eliminated the elaborate sets and costumes used in classical ballet and presented the dancers as equal on stage, not as principals and corps. Two of his plotless ballets are ***Concerto Barocco*** in 1941 and ***Agon*** in 1957. He did however choreograph narrative ballets – ***The Prodigal Son*** in 1929 and revised in 1950; and ***A midsummer Night's Dream*** in 1962.

Since the 1900s, the length of ballets has varied from short works to full length ballets that are several hours long. Some modern ballets tell a story; others describe a mood or express the feelings and movements aroused by the music or by some other factors, such as painting and nature. Current dance styles reflect the speed, pressures, and complexity of modern life.

MODERN DANCE

Modern dance was developed in the early 1900s pioneered by Isadora Duncan, Louie Fuller, and Ruth St. Dennis in the United states; Emile Jacques-Dalcroze of Switzerland, and Rudolf Von Laban of Hungary. These leaders of the modern dance movements believed that the techniques of ballet were artificial and meaningless. They searched for fresher, more personal ways to express ideas through dancing.

Isadora Duncan, one of the most spirited pioneers, danced in her bare feet and wore loose-fitting garments that allowed her freedom of movements. She did not

permit scenery onstage which might draw attention from her dancing, ignored the formal, set movements of ballet. Her flowing movements were inspired by nature, classical music, and Greek drama and sculpture. Her ideas greatly influenced the development of not only of modern dance but also of ballet. Oriental religions inspired the dances of *Ruth St. Dennis*, who won fame during a tour of Europe from 1906 to 1909. She and her husband Ted Shawn opened the famous Denishawn School of Dancing in 1915 in Los Angeles. The school moved to New York in 1922. Many former students including *Martha Graham* and *Doris Humphrey* developed more personal styles. Graham, Humphrey and her husband Charles Weidman formed their own dance companies. *Mary Wigman* became Europe's first great modern dancer. She founded an influential dance school in her native Germany in 1920. Since the 1940s, creativity in modern dance has centered on U.S. dancers and dance companies. Modern dance works today place less importance on emotion and personal expression; instead, they explore movement for its own sake.

TAP DANCE

Tap dancing is believed to have been created by the blending of the Irish jig and the English clog with the Negro Shuffle. It dominated the Vaudeville shows of the late 1800s and remained popular well into the 19th century. Tap dancing is a style of dance in which rhythmic sounds are produced by moving the feet. Shoes are worn with metal taps on the bottom, which produce the distinctive tap sound against the floor. **Bill "Bojangles" Robinson** was one of the first of many African-American artists who popularized tap dance.

INTERNATIONAL FOLK DANCING

SOME INTERNATIONAL DANCE TERMS

- **ADDRESS PARTNER.** Same as honor your partner or bow to your partner.

- **ALLEMANDE LEFT.** The boy turns to the girl at his left and takes her L hand in his L hand and turns her once around counterclockwise, then both falling back to places.
- **ALLEMANDE RIGHT.** The boy faces his partner, takes her right hand in his right hand and turns her once around clockwise, then falling back to places.
- **BOW/ SALUDO.** Partners bow to each other, to opposite dancer or to the audience. This is of Spanish origin.
- **CABECERAS.** The couples occupying the width of the dance floor in a square formation.
- **CAST OFF.** When dancers are in long formation, the leader or the head couple counter marches outward to the end of the line where the last couple was, then counter-march inward to proper places.
- **CIRCLE LEFT AND RIGHT.** The designated couples or dancers join hands and walk to left with light springy steps clockwise and then to the right counter clockwise, falling to home positions.
- **COSTADOS** The couples occupying the length of the dance floor in a square formation.
- **CROSS OVER.** Two couples are facing each other, each couple proceeds in a straight line to the opposite place. The girls pass by their L shoulders between the boys. Boys bow to each other when they meet at the middle or about one-third of the way, then proceed to the opposite place. Upon reaching the opposite place, partners turn about; girls stand at partner's left shoulder.
- **DRAW.** The free foot is drawn toward the supporting foot, by pressing the toes against the floor as the close is made, with or without transfer of weight.

- ## SOME COMMON INTERNATIONAL FOLK DANCE STEPS

DANCE STEP	TIME SIGNATURE			STEP PATTERN & COUNTING	
ACCENTED RUNNING STEP	3/4	Stamp 1	Step 2	Step 3	1M

BALLROOM WALTZ	3/4	Step R (L) 1	Slide L (R) 2	Close R (L) 3	1M
BLEKING	2/4	Spring on L (R) & Heel-place R (L) 1			or
		Heel-Place R (L) 1	Close (step) R (L) 2	1M	
	3/4	Heel-Place R (L) 1,2	Close (step) R (L) 3	1M	

3/4 Boy: Step L forward Step R sideward Close L to R |
 1 2 3

Step R backward Step L sideward Close R to L || 2M
 1 2 3

BREAK LEGS 2/4 Jump to feet apart sideward (ct. 1), spring to face right (left) and kneel on L (R) (ct. 2). 1M

CHASSE	2/4	Slide R(L) sideward (ct. 1), step L (R) close to R(L) (ct. and). Two chasse' steps in one measure.
CROSS POLKA	2/4	With an inward foot circle in the air of the R (L) foot, hop on L (R) (ct. and of previous M) and execute the polka step forward crossing the R (L) foot over the L (R) first (cts. 1 and 2). 1M

CROSS WALTZ 3/4 Step R (L) across L (R) in front and raise slightly the L (R) across in rear (ct. 1, step L (R) in third position in rear (ct. 2), step R (L) forward (ct. 3). There is a slight bending of the knees on ct. 1. Step on the ball of the rear foot on ct. 2. 1M

DUTCH STEP 3/4 Step R(L) sideward (ct. 1), brush L (R) heel forward with toes pointing upward (ct. 2), hop on the R(L) in place (ct. 3). 1M

GRAPEVINE 2/4
Step 1 Cross-step (in rear) 2 | Step 1 Cross-step (in front) 2 || 2M

3/4
Step 1,2 Cross-step (in rear) 3 | Step 1,2 Cross-step (in front) 3 || 2M

HOPSA 2/4 Leap sideward R(L) (ct. 1), step L (R) across R(L) (ct. and), close R(L) to L (R) (ct. 2), pause (ct. and). 1M

HEEL AND TOE POLKA (Old) 2/4
Place the R (L) heel in front (cts. 1 and), touch the R (L) toe in rear (cts. 2 and), and execute plain polka forward (cts. 1 and 2 and). This is usually done forward. The polka may be preceded by a hop. 2M

HUNGARIAN TURN 2/4 Partners place right arms around each other's waist arm encircled overhead. Hop on R (L) (ct. 1), small step on L (ct. and), small step on R (cts. 2 and), and continue to complete the turn, usually four measures. 1M

JUMPING JACK 2/4 Full-knees bend with knees apart, cross hands down in front (ct. 1), jump to standing position, with feet apart sideward, toes pointed upward and fling arms obliquely upward, palms facing front (ct. 2). 1M

MAZURKA 3/4 Slide R (L) 1 Cut R (L) with L (R) 2 Hop on L (R) 3

MINCING STEP 2/4 Step 1 Step and 2 Step and (tiny steps || 1M heels slightly raised)

MINUET STEP 3/4 Three small steps forward on the balls of the feet (cts. 1 2 3), point L (R) in front and bring heel of the R down (cts. 1 2 3). 2M

OPPOSITE TORTILLIER 2/4 Toes together 1 Heels together 2 || 1M

3/4 Toes together 1,2 Heels together 3 || 1M

PARALLEL TORTILLIER 2/4 Pivot on heels and turn toes both 1 Pivot on toes and turn heels both 2 || 1M

3/4 Pivot on heels and turn toes both 1,2 Pivot on toes and turn heels both 3 || 1M

PAS DE BASQUE 3/4 Half-foot circle in the air with the L (R) foot and leap sideward (ct. 1), slide R (L), slide R (L) to fourth position (ct. 2), cut R (L) forward with the L (R) foot (ct. 3). 1M

POLKA (Old Hop Polka) 2/4 Hop R (L) Step L(R) Close R (L) Step L (R) || 1M
and 1 and 2

RUSSIAN POLKA 2/4 Heel-brush R (L) Heel- step R (L)
and 1
Close L (R) Step R (L) foot || 1M
2 and

PRYSIADKA 2/4 Full-knee bend on R (L) and stretch L (R) leg forward
(ct. 1), with a spring reverse the position of the feet
(ct. 2). 1M

ROCKING STEP 2/4 Fall on Right forward Fall Left backward
Raise Left in rear Raise Right in front
1 2 || 1M

RUBBER LEGS 2/4 Step L across R in front, and twist R foot so that the
sole is off the floor facing outward (ct. 1), transfer
weight to R foot and twist the left foot so that the sole
is off the floor facing outward (ct. 2). 1M

RHEINLANDER STEP or **SCHOTTISCHE** 4/4
Step R sideward (ct. 1), close L to R (ct. 2)
step R sideward (ct. 3), hop on R, swing the
L foot in front (ct. 4). 1M

SHUFFLING STEP 2/4 Slide Slide Slide Slide || 1M
1 and 2 and
Tiny slides on balls of feet

3/4 Slide Slide Slide Slide Slide Slide || 1M
1 and 2 and 3 and
Tiny slides on balls of feet

VARSOUVIENNE STEP 3/4 Slide R foot diagonally forward R(ct. 1), step
L close R in third position (ct. 2), step R sideward
(ct. 3), point L foot in front (cts. 1 2 3). 2M

WALTZ BALANCE 3/4 Step R forward Close L to R Both heels down
and raise
both heels
1 2 3 || 1M
Can be done moving backward

MODERN BALLROOM DANCE

Over the centuries every kind of ballroom dance rhythm had been tried out, some being discarded, others going on to become popular dance. The original steps differ considerably from those used at the height of their popularity. The dance must be in keeping with the spirit of the times. Impressive modifications will probably be made. Movements changed or omitted or new ones included.

Dance in the ballroom maintained its continuing identity as a polite art, standard four dances" – the foxtrot, the waltz, the tango, and the quick step had been codified in England. The insidious rhythm of the so-called Latin-American dances were introduced throughout the 1920's and 1930's.

Posture

Posture refers to the efficient body carriage. It is the basis of graceful and attractive dance movement. **Good posture** is much more natural, functional and comfortable.

Body control is attained through effective posture and a strong sense of balance.

Dance walk is an important part of dancing, and it is done gracefully and with appropriate style. “Contra body motion” is a subtle element of style in the dance walk.

Feet are kept close together. The travel is straight forward or backward, not swaying or waddling from side to side. Make sure the body is held forward and moves just before the leading foot. Arms are held high, and the body is erect. Glide the traveling foot always, transfer the weight smoothly with no sudden jarring.

“Contrabody motion” is used when you step forward with the right foot bring the left shoulder slightly forward and vice versa.

Your knowledge of the suitable couple dance position is an important element for effective social and ballroom dancing.

Balance

Good balance comes with control of movement. The weight is carried forward with the moving foot. Good balance comes with control of movement. When you are moving forward or backward keep your feet in a straight line. Do not try to avoid your partner’s feet by walking outside them. Carry your weight forward with the moving foot. When moving backward, you step on the toes, bringing the weight gradually back with the forward foot before taking the next step.

The Head

Since the head is heavier than the other parts of the body. Keep the head up. Hold the chin naturally in. Keep the eyes at their usual level.

The Body

The body is held in a natural, erect position without raising the shoulders or

pushing out the chest. Those who look stiff are keeping their muscles taut. The controlled appearance is shown by holding up your arms and elbows without raising the shoulders. The lady does not hang on her partner, either weighing him down with heavy arms or holding him tightly and her left hand should be rested lightly on his right upper arm, fingers neatly closed together. The diaphragm muscles are made as the center of control of the whole body.

The Legs

The movement of the legs should be free and from the hips not the knees. Natural bracing and relaxing movements are used in every step made. When there is room to move, the knees are at their straightest or locked, but not stiff at the full extent of a stride, and relax slightly as the weight is taken on the foot.

The Feet

The feet should be kept straight. Out-turned toes are a common fault. Try to feel your feet brushing past each other as you dance both forward and backward step. Use your ankles properly. When you have reached the full extent of a stride forward, the ankle should be stretched with only the toes touching the floor, not the ball of the foot, before you move the front foot into its next position.

LINE OF DANCE (LOD) – is the direction that one takes when dancing round the ballroom counter-clockwise.

Timing Effect

Timing effect is important for you to coordinate your movements with the music. There are types of count – musical count, the number and sequence of beats to the measure and dance count, the sequence of steps and whether the weight should be sustained on each succeeding transfer for two beats or for one beat.

THE WALTZ

The waltz was derived from an old German word walzen, meaning to turn, to roll or to glide. It was born in the suburbs of Vienna and in the alpine regions of Austria. It is a progressive dance written in $\frac{3}{4}$ time where the first beat measure is accented.

Characteristics of the Waltz:

- Erect posture and rise-and-fall. The first step of the measure is taken with bent knee and followed on the second and third steps by both partners rising to full height on balls of the feet.
- Forward steps are taken on the heel and directly toward the partner.
- On side steps, both partners sway slightly away from their direction of travel.
- Partners stay fairly close together and take a long reaching steps.

Basic Step: Commence and end in Closed Ballroom Hold

Man: Step L forward (ct. 1), step R sideward (ct. 2), close L to R (ct. 3)

Woman does the opposite moving backward

CHA – CHA – CHA

In 1953, the Cuban Orchestra America started playing the time-honored danzon with a new syncopated beat. It sounded like a slow mambo, and Cuban dancers used a slight triple hip undulation on the slow count. This was change gradually into triple step on the slow count, thus cha-cha-cha was born. It was introduced in the US in 1954.

Cha-cha-cha- is written in “cut” time with four count rhythm. It is the most popular of the Latin dances. It has a catchy rhythm.

Characteristics:

- Shoulders remain quiet and free arms are kept at about shoulder level with palms down.
- All steps are taken on the flat of the foot with the exception of the back step which is taken on the ball of the foot with weight kept well forward.
- Forward steps are taken with weight held back.

Timing: Take the forward of leading step off the second beat of the bar of music.

Rhythm:	Slow 2	Slow 3	Quick 4	Quick and	Slow 1
----------------	-----------	-----------	------------	--------------	-----------

Side Basic: For man: A. L forward, R in place, chasses sideward L
(slide, close, slide) B. R backward, L in place,
chasses sideward R
Woman does the opposite.

THE TANGO

The word “Tango” is thought to be African in origin, and denotes a “meeting place” or “special place”. This does not mean that Tango itself is of African origin. The Cuban Habanera, the Spanish Contradanza and the Afro-Argentinian Candombe all influenced the evolution of Tango, but no dance more than the Milonga. Milonga means “party” or “fiesta”. Ballroom tango originated among the lower classes in Buenos Aires, Argentina during the 19th century. It was called baile con corte, a dance with a stop. To produce a more dreamy effect, the original rhythm was substituted to habanera rhythm, resulting in a dance called Milonga. The music itself was lively, vivacious and joyful. Although initially popular with the lower classes, by the turn of the 20th century it gained acceptance among the upper classes. It was introduced in France at the turn of the century and into England in 1912.

Tango Argentino is a much more intimate style of dance than the modern Tango, and is well suited to dancing in small settings.

Characteristics:

1. A graceful progressive dance with a basic rhythm of slow-slow-quick-quick-slow.
2. The hold is unique, with partners in close contact and “no daylight” between them. The man’s right arm is farther around the woman and his left arm closer to the body.
3. It is a staccato dance.

Basic rhythm:

Slow	Slow	Quick	Quick	Slow
1,2	3,4	5	6	7,8

or:

1	2	1	and	2
---	---	---	-----	---

Progressive Walk: Man - Step L forward, step R forward, step L forward (small step), step R forward (small step), step L forward.
Woman does the opposite moving backward.

ROCK ‘N’ ROLL

When Benny Goodman ‘s swing band gave a concert at the Paramount theater in new York, in 1937, teenagers went wild and poured into the aisles to “Jitterbug” as the newspaper called the dance. The craze swept across America. Variations in techniques led to styles such as Boogie woogie and Swing boogie, with “jive” gradually emerging as the generic that covered Lindy Hop, Jitterbug and Boogie Woogie dances. Whichever term used in the 1940’s, the music was Swing. After the Second world War, bands got smaller and the music changed. By the 1950’s, the music was no longer as smooth and polished as Swing but it had huge popular appeal; this

music was Rock ‘N’ Roll. From Lindy Hop emerged another dance style, the Rock ‘n’ roll.

Rock ‘n’ Roll is an interesting and fascinating dance, sometimes referred to as a Single Beat Jive.

1. The man begins all the figures with his left foot and the lady with her right.
2. the rhythm for all the basic figures is Slow, Slow, Quick, Quick (2 beats for each “slow” and 1 beat for each “quick” step).
3. all the steps are taken on the ball of the foot, then on to the flat foot.
4. When taking a “slow” step, sway the body very slightly towards the foot you are stepping with.

JIVE

The main difference between the Rock n’ Roll and jive is that Jive is danced in what is called Triple Rhythm while Rock n’ Roll uses “quick a quick” rhythm in place of “Slow” rhythm. the music is written in 44 time, and two different rhythms form its basis;

1 –Bar construction;	Step	Step	Jive Chasse
	1	2	3 a 4
	Quick	Quick	Quick a Quick

2-Bar Construction:	Step	Step	Jive chasse	Jive Chasse
	1	2	3 a 4	3 a 4
	Quick	Quick	Quick a Quick	Quick a Quick

FOXTROT

The foxtrot is a “smooth” dance where the movements are flowing, the weight of the body traveling continuously. It is written in 44 time. There are types of foxtrot.

the International (English) quickstep where the figures are not exceptionally different but are challenging because of the tempo of the music; the Peabody which is a fast foxtrot; the graceful Roseland foxtrot where the music is played at a moderate tempo and combines a quick – quick- slow rhythm with frequent use of the outside position; the slow foxtrot sometimes called “music to hug by”; and the slow to medium foxtrot which is suited for beginners. The rhythm may be slow-slow-quick – quick or slow- quick – quick.

Basic Step: Man: Step L forward, step R forward, step forward on ball of L, step forward on ball of R.
Woman does the opposite moving backward.

RUMBA

The “international” style Rumba owes an inestimable debt to the Cuban “Guajira”, an earlier folklore dance, and the name of which points to its rural origin. In the Cuban tradition, the verb rumbiar simply means to dance, and “Rumba” is a generic term that can refer to a variety of dances or even a “dance party. In the Spanish-speaking world, the Rumba to which we now refer is often known as the “Bolo-ro-Rumba”. The “Square Rumba”, an even more compact close-hold style than the current form, first came to prominence in the early 1930s. By the late 1940s, as the style developed in Europe and the United States, the perhaps somewhat –inaccurately called “Cuban Rumba” was beginning to emerge, with more figures danced in open hold, enabling a more dynamic approach and greater fluency in the dance.

The dancer normally makes the actual foot movements only on beats 2, 3, 4, with a controlled and very slight lateral hip action on beat 1.

Count: 2 3 4-1
 Quick Quick Slow

Basic: Man: Step L forward, step R in place, step L sideward
Woman does the opposite.

SAMBA

The original Brazilian sambas were written in 24 time, but the dance we know today is almost always played in “cut” time with a syncopated pulsing beat. The rhythm consists of three steps to two counts of music, which many dancers call step-and-cut.

Characteristics of the Samba:

- Pendulum motion, where the entire body sways opposite to the feet (step forward, sway back; step right, sway left and so forth).
- continuous bending and straightening of the knees, which adds to the samba’s smooth lilting effect.

Because of the fast tempo, all steps in samba are fairly short.

Basic Steps: Man: Step forward on left foot (3/4 count), nearly close right foot to left foot, taking partial weight on the ball of the foot (1/4 count), almost simultaneously closing the left foot to the right foot with a pulling action from the hip (the cut) to take full weight for one count.
Woman does the counterpart.

The PASO DOBLE

Paso Doble is a Spanish dance and the movements danced by the man are symbolic of those made by the torero (or matador) in the bullring. The lady represents the cape and her movements suggest the cape passes made during a bull fight. The music is played in a March time.

Basic Movement: Man or Lady: Normally begin with right foot as man and left foot as lady on the first beat of the bar of music. Dance a series of small

steps forward or back (straight or curved either to Right or Left), changing weight from one foot to the other (on the ball of each foot) with the knees very slightly relaxed. The steps are taken with pressure into the floor.....count 1, 2, 1, 2

MAMBO

The mambo is written in “cut” time with a four-count rhythm corresponding to four quarter notes. The primary accent is on the second count of the measure, and there is a secondary accent on the fourth count of the measure. Syncopation is often achieved by tying an accented note to the following weak note, thereby providing a jerky staccato effect.

Rhythm: quick quick slow
 4 and 1

Characteristics:

- This is similar to cha-cha, except that the triple becomes step-hold.
- Knees are soft and all steps except back steps are on the flat of the floor.
- Weight is held forward on back step and held back on forward steps.

PART II – ANALYZING TEST ITEMS

1. Bharata Natyam is the oldest dance in the world, originally performed in the temples of India. It combines rhythmically complicated dancing with Hindu legends told in song and pantomime. Like other Indian dance forms, this temple dance uses hand gestures that have recognized meanings that often stand for animals, plants, or feelings. This hand gestures are called ____.
 - a. Natya
 - b. Mudras
 - c. Nritya
 - d. Nritya

The answer is **b** (Mudras) because option a (Natya) is a component of the Indian classic dance which means the dramatic quality while option c (Nritya) is another component which has something to do with the expressive possibilities of conveying the sentiment and mood through facial expression and bodily gestures and option d (Nritta) is the rhythmic aspect of the dance.

2. One of the rare indications about the earliest and unique dance has to do with the use of a long sleeve known as “water sleeve” as a technical and expressive side of the dance and appears to be part of shamanistic worship. Sleeve dancing was widespread in _____.
- a. China
b. Burma
c. Korea
d. Indonesia

The answer is a (China) because option b (Burma) is not uniquely Burmese. It had the pwe, which is performed outdoors and can last all nights while option c (Korea) had dance that reflects the historical and strategic importance of the country and were an essential factor of religious worship and of the nature cult that surrounded the planting and harvesting and option d (Indonesia) just like other Southeast Asian dances had the barong, where dancers in a trance, act out a legendary battle between a dragon and a witch.

3. The European folk dances contain memories and references to religious or magical dances. These dances are traces of the ancient worship of the sun
 - a. Maypole dances
 - b. Bonfire dances
 - c. Ring dances
 - d. Sword dances
4. Cotillion was in vogue in the 18th century. Its name was derived from the French cote, which was a short petticoat worn by peasants. Which of the following square dances that emerged during the Napoleonic years in France at about 1740 was the descendant of the Cotillion?
 - a. Quadrille
 - b. Minuet
 - c. Virginia Reel
 - d. Basse Danse
5. This is a maypole dance which is performed in May is presided over by the “senior” (Our Lord) of Chalma, and offerings of eggs, necklaces, beads and flowers can be made after each dance.
 - a. Los Inditos
 - b. Los Viejetos
 - c. Los Moros
 - d. La Costilla
6. Cha Cha Cha is a descendant of the -
 - a. Samba
 - b. Cuban Mambo
 - c. Rumba
 - d. Tango
7. In the 14th century, Carole which involved song and simple dance steps was the perpetuation of the most ancient of the social dance forms. In its linked form in single file, it evolved into –
 - a. Farandole
 - b. Estampie
 - c. Branle
 - d. Basse Danse
8. Important and significant adaptations from folk elements were the Contredanses, the linguistic adaptation of the English – country dances. Later on, it was transformed into French contredanses. The dance figures were grouped into a general title which was in vogue in the 18th century. Its name was derived from the French cote, which was a short petticoat worn by peasants. This was –
 - a. Quadrille
 - b. Waltz
 - c. Cotillion
 - d. Polka
9. The dance that provided a release from wartime pressures.
 - a. Jitterbugging
 - b. Boogie-Woogieing
 - c. Discoing
 - d. Break dancing
10. One of the most spirited pioneers of modern dance who did not permit scenery onstage which might draw attention from her dancing, ignored the formal, set movements of ballet.
 - a. Ruth St. Dennis
 - b. Doris Humphrey
 - c. Isadora Duncan
 - d. Martha Graham
11. He founded the Royal Academy of Dancing to train professional dancers to perform for him and his court. Professional ballets began in the king's dancing academy.
 - a. Balthazar de Beaujoyeulx,
 - b. Rudolf Von Laban
 - c. King Louis XIV
 - d. Ted Shawn
12. What is the “capital” of the ballet world as established by the Ballet Comique de la Reine which was considered to be the first ballet with spectacular costumes and scenery to impress the audience, ran for 51/2 hours performed in 1581 in honor of a royal wedding?
 - a. Italy
 - b. Germany
 - c. United States
 - d. Paris
13. A style of dance in which rhythmic sounds are produced by moving the feet.
 - a. Tap dance
 - b. Zapateado
 - c. Modern dance
 - d. Stampas
14. This is one of the types of FOXTROT, which a graceful foxtrot and the music

- is played at a moderate tempo and combines a quick – quick- slow rhythm with frequent use of the outside position .
- Peabody
 - Roseland foxtrot
 - International quickstep
 - Slow-to-medium foxtrot
- The basic technique of this so-called “a new form of sexual display typified by the gigolo image of the sultry Southern male was accepted by the public in 1930.
 - Rumba
 - Samba
 - Barn dance
 - Rock n’ Roll
 - This term also known as Mill or Wheel Right and Left.
 - Ilemande Right and left
 - Star Right and Left
 - Grand Right and Left
 - Cadena
 - Break Legs is executed in a 24 time music and the counting is –
 - 1 and 2 and
 - 1 and 2
 - 1 2
 - 1 2 and
 - How many measures will it take to execute two (2) Box Square Waltzes?
 - 1 measure
 - 2 measures
 - 3 measures
 - 4 measures
 - The Dutch step is executed in 34 time signature, and the step pattern is –
 - Slide Cut Hop
 - Heel-place Close
 - Step Heel-brush Hop
 - Deep-knee Bend Jump (feet apart)
 - Half-foot circle in the air with the L (R) foot and leap sideward (ct. 1), slide R (L),slide R (L) to fourth position (ct. 2), cut R (L) forward with the L (R) foot (ct. 3). This is the step pattern for –
 - Varsouvienne step
 - Pas de Basque step
 - Rheinlander step
 - Hopsa step
 - The dance step pattern “Step L across R in front, and twist R foot so that the sole is off the floor facing outward (ct. 1), transfer weight to R foot and twist the left foot so that the sole is off the floor facing outward (ct. 2).” is the pattern for –
 - Hopsa
 - Prysiadka
 - Rubber Legs
 - Dutch step
 - How many measures will it take to execute four (4) Minuet step moving forward?
 - 4 measures
 - 7 measures
 - 6 measures
 - 8 measures
 - Which of the following dance steps is executed in 44 time signature?
 - Jumping Jack
 - Hungarian turn
 - Russian Polka
 - Rheinlander Step
 - In the dance Samba, this is executed, where the entire body sways opposite to the feet (step forward, sway back; step right, sway left and so forth).
 - Swaying motion
 - Contra body motion
 - Pendulum motion
 - Rise-and-fall motion
 - The timing effect “Slow Slow Quick Quick Slow“ can be dance counted as-
 - 1 and, 2, 3, 4
 - 1, 2 and, 3, 4
 - 1, 2, 3 and, 4
 - 1, 2 and, 3, 4 and

PART III – ENHANCING TEST TAKING SKILLS

1. This Japanese word means play and was believed to be the main idea of Oriental Dances.
 - a. Hara Kiri
 - b. Sakura
 - c. Asobi
 - d. Kabuki
2. In the ethnic tradition of Philippine dance, what dances transform defenses and livelihood activities to celebratory dances?
 - a. Life-cycle dances
 - b. Occupational dances
 - c. Imitative dances
 - d. Ritual dances
3. Became extremely popular in the 19th century in Europe was a form of quadrille which combined contredanses and cotillions.
 - a. Square Dance
 - b. Virginia Reel
 - c. Rigodon
 - d. French Quadrille
4. In Central Europe, this dance originally from Bohemia and introduced in Paris in 1840 was feverishly welcomed as a fashionable ballroom dance of tremendous energy.
 - a. Mazurka
 - b. Waltz
 - c. Polka
 - d. Galop
5. In the Cuban tradition, the verb rumbiar simply means -
 - a. to dance
 - b. to turn
 - c. to move
 - d. to glide
6. This is a Mexican hat dance of Mexico.
 - a. Joropo
 - b. Jarabe Tapatio
 - c. Zapateado
 - d. Cuenca
7. This was a lively dance in triple meter that gained popularity during the time of King Louis XIV, the Sun King. The small steps were essential part of the dance.
 - a. Courante
 - b. Pavane
 - c. Sarabande
 - d. Minuet
8. John Philip Sousa, the King of March produced many popular marches. This dance was basically a marching step with interpolated skips became popular.
 - a. One-step
 - b. Boston Two-step
 - c. Twist
 - d. Mambo
9. In 1900, this jerky Negro rhythms challenged the smoothly gliding waltz.
 - a. Cakewalk
 - b. Bunny Hug
 - c. Jitterbug
 - d. Boogie-Woogie
10. This was classical ballet choreographed in 1890 by Petipa and first performed in Russia.
 - a. Sleeping Beauty
 - b. Midsummer Night's Dream
 - c. Fierbird
 - d. Swan Lake
11. The Russian choreographer who defected to America in 1933 was one of ballet's greatest innovators and is considered by many to be the greatest contemporary ballet choreographer.
 - a. Marius Petipa
 - b. Lev Ivanov
 - c. George Balanchine
 - d. Michel Fokine
12. She became Europe's first great modern dancer. She founded an influential dance school in her native Germany in 1920.
 - a. Martha Graham
 - b. Mary Wigman
 - c. Ruth St. Denis
 - d. Doris Humphrey
13. Dance in the ballroom maintained its continuing identity as a polite art. Standard four dances had been codified in England. Which of the following options contain the standard four dances?
 - a. Foxtrot, Rumba, Tango, Quickstep
 - b. Foxtrot, Waltz, Tango, Quickstep

- c. Jive, Paso Doble, Rumba, Cha Cha Cha
d. Cha Cha Cha, Waltz, Foxtrot, Jive
14. The dance Samba is innately –
a. an Argentinian dance c. a Cuban dance
b. a Spanish dance d. a Brazilian dance
15. What dance imitated of the bull fight which stemmed from Spain but was refined for the ballroom in the Southern region in France, The man represents the matador, the lady his cape.
a. Paso Doble c. Mambo
b. Samba d. Swing
16. This is the dance term used, when the boy turns to the girl at his left and takes her L hand in his L hand and turns her once around counterclockwise, then both falling back to places in a square formation.
a. Allemande Left c. Allemande Right
b. Circle Left d. Circle Right
17. The couple's original position in a set.
a. Corner position c. Home position
b. Opposite position d. Costado
18. Leap sideward R(L) (ct. 1), step L (R) across R(L) (ct. and), close R(L) to L (R) (ct. 2), pause (ct. and) is the dance pattern of what dance step?
a. Pas de Basque c. Leap step
b. Hopsa d. Polka step
19. All of the following international dance steps can be executed in 24 and 34 signatures, EXCEPT –
a. Grapevine c. Bleking
b. Shuffling d. Hopsa
20. Which of the following is the step pattern for Ballroom Waltz/
a. Step close step c. Slide close step
b. Step slide close d. Step step close
21. What makes Russian polka distinct from other polkas?
a. There is the hop on count and of the previous measure.
b. There is an inward foot circle on the air and a hop on count and of the previous measure.
c. There is the heel brushing first on count and of the previous measure before putting weight on it.
d. There is the heel-place in front and a toe touch in rear.
22. Which of the following is the step pattern for Prysiadka?
a. Full-knees bend with knees apart, crosshands down in front (ct. 1), jump to standing position, with feet apart sideward, toes pointed upward and fling arms obliquely upward, palms facing front (ct. 2).
b. Step R sideward (ct. 1), close L to R (ct. 2) step R sideward (ct. 3), hop on R, swing the L foot in front (ct. 4).
c. With an inward foot circle in the air of the R (L) foot, hop on L (R) (ct. and of previous M) and execute the polka step forward crossing the R (L) foot over the L (R) first (cts. 1 and 2).
d. Full-knee bend on R (L) and stretch L (R) leg forward (ct. 1), with a spring reverse the position of the feet (ct. 2).
23. Richie is tasked to execute four (4) varsouvienne steps by his professor. How many measures will it take for Richie to complete the task?
a. five measures c. seven measures
b. six measures d. eight measures
24. The 1 –Bar step construction of Jive is “Step Step Jive Chasse”. Which the following is its timing?
a. Quick Quick Slow c. Slow Slow Quick Quick Slow
b. Quick Quick Quick a Quick d. Slow Quick Quick
25. The rhythm “Slow Slow Quick Quick Slow “ or “ 2 3 4 and 1” is an off-beat rhythm for –
a. Rumba c. Cha Cha Cha
b. Samba d. Paso Doble

Methods and Techniques of Teaching Physical Education and Health

Prepared by:

Dr. Salve A. Favila and Prof. Aquilino Eduardo P. Santos

Competencies:

1. Identify methods and techniques in teaching physical education and health.
2. Apply teaching methods and techniques in physical education and health with emphasis on classroom and outdoor/field class management.
3. Use appropriate assessment strategies.

PART I - CONTENT UPDATE

METHODS AND TECHNIQUES OF TEACHING

What is Method?

- The word *method* comes from the Greek *methodos*, which in turn comes from two Greek words, *meta* (after) and *hodos* (way) (Lardizabal, et.al. 1997).
- In the dictionary definition, it can be understood that it is an orderly and systematic mode of procedure to do something in accordance with a definite plan in order that the predetermined objective is attained.
- Strategy is equated with method (Sanchez, 1996). Method or strategy is procedural because it consists of specific sequential steps to be followed.
- Strategy represents the method the teacher has selected to achieve a particular objective (Capel, 1997).

Sanchez (1996) categorized the strategies into two types:

1. **Expository strategy** which is also termed as “information giving strategy” since the teacher is the main source of information. It is employed if the materials to be used by the students are delicate and dangerous, when the subject matter is difficult, and when students are pressed for time. Its chief disadvantage is that creativity of the students is not developed.
 - Lecture
 - Lecture-Demonstration
 - Film-showing
 - Handout method
 - Dictation

2. **Enabling strategy.** In using this strategy the students are the ones who look for the answers to the questions, they themselves have formulated, and the teacher acts as a facilitator of learning. This is a dynamic type of learning activity where students are active participants in the teaching-learning process, and it develops students' creativity. Its only disadvantage is that it takes a long time for the students to finish a unit of study because of the various processes to be undertaken.

Some enabling strategies are: **inductive method, deductive method, case study, project method, participatory method, experimenting, field trip, question and answer method, simulation, role playing, dramatization, supervised study, and game.**

What is Technique?

- Technique refers to the art or skill of performance in teaching.
- Sanchez (1996) says, it refers to the actual act (including all manipulations of instruction including the use of devices and the principles in teaching to effect proper learning).
- Technique is usually equated with style. A teacher's teaching style can be defined as the combination of the strategies commonly used, together with personal characteristics (Capel, 1997).
- A style of teaching is basically a set of decisions made in conjunction with the teaching act. The shift from one style to another is facilitated by the transfer of certain of these decisions from the teacher to the students (Dougherty and Bonanno, 1979).

There have been different teaching styles that were discussed and applied successfully in various physical education classes. Physical education professionals have presented, labeled, and categorized these styles in many ways and many of

the terms overlap and can be confusing to beginning teachers of physical education.

A teaching style is an overall scheme in organizing the educational environment. The style provides direction for the specific involvement and role of the teacher and students in the process (Pangrazi, 1991).

A teaching style should;

- A. Provide direction for presenting students with information, organizing students for practice, providing feedbacks to students, keeping students engaged in appropriate behavior, and monitoring students' progress toward goals or objectives; and
- B. Be analyzed in terms of the teacher's planning and set up of the environment, the teacher's and the student's behaviors during the lesson, and the student's outcome variables.
 - **Teacher planning and set up** includes any evidence of preplanning such as lesson plans, organizational arrangements or instructional devices.
 - **Teacher's behavior** includes instructions, questions, management cues, feedback, and demonstrating.
 - **Student behavior** during the lesson includes activity time, waiting, receiving information, management time, and the like.
 - **Student outcome** variables include physical fitness levels, physical skills, knowledge, social-emotional behaviors, and attitudes toward the activity.

There is no best universal teaching method. There is no evidence that one strategy is more effective than the other. That which attains the objectives within the allocated time can be considered the best for that particular situation. It is also possible that a combination of strategies or methods is applied in one lesson so that the objectives can be attained.

What are the Factors to Consider in the Choice of Method?

The choice of method is important especially for a beginning teacher, who faces a class of fifty students for the first and bewildered about what he should do.

As mentioned by Corpus and Salandanan (2003), there is no single best method or strategy; the best is that which brings about maximum and optimum learning.

To cater to students with multiple intelligences and different learning styles, there are a lot of teaching methods or strategies to choose from.

Many variables must be considered before an appropriate strategy can be selected. These variables include:

1. The objectives of the lesson (physical skills, physical fitness, knowledge, and social behaviors)
2. The nature of the activities involved (sports, dance, movement skills)
3. The nature of the learners (individual characteristics, interests, developmental level, socio-economic status, motivation, and background)
4. The total number of students in the class
5. Adequacy of the school equipment and facilities (courts, rackets, cassettes, CDs)
6. The abilities, skills and comfort zone of the teacher

Physical education teachers should have a repertoire of strategies. Teachers who can implement a variety of strategies can use different combinations of styles to motivate students.

MODELS OF INSTRUCTION

DIRECT MODEL OF INSTRUCTION

It clearly tells students exactly what, where, with whom, with what, and how. Direct instruction is a process where teaching of facts, rules, and action sequences is most efficiently achieved. It is a teacher-centered strategy in which the teacher is the major information provider.

Modeling – a teaching activity that involves demonstrating to learners what you want them to do. It is a direct teaching activity that allows students to imitate from demonstration or infer from observation the behavior to be learned.

Characteristics:

1. Your role as a teacher is to pass facts, rules, and action sequences on to your students in the most direct way possible.
2. It usually takes presentation and recitation format with explanations, examples, and opportunities for practice and feedback.
3. Presentation-recitation format does not only require verbal explanations from you, but also teacher-student interaction involving questions and answers, review and practice, and the correction of student errors.
4. The “lecture” is a quickly paced, highly organized set of interchanges that you control, focusing exclusively on acquiring a limited set of pre-determined facts, rules, or action sequences.

INDIRECT MODEL OF INSTRUCTION

It can challenge the critical thinking of students when properly used. Indirect instruction is an approach to teaching and learning in which the process of learning is inquiry, the result is discovery, and the learning context is a problem. Inquiry, problem solving, and discovery are different forms of the more general concept of

indirect instruction. The model provides instructional strategies that encouraged the processes of generalization and discrimination for the purpose of forming concepts, patterns, and abstractions.

CONCEPTUAL MOVEMENTS

Both induction and deduction are important methods for teaching concepts, patterns, and abstractions.

Inductive method is a procedure through which one may arrive at a fact, principle, truth, or generalization. This strategy moves from particular to general. Instances or cases are studied, observed, and compared and the common elements in them are discovered and generalize.

The steps are:

1. **Preparation** which involves apperception, motivation, and statement of the aim.
2. **Presentation** where specific cases or instances are presented to the class.
3. **Comparison and abstraction** where the common element among specific cases is deduced. Each case should be evaluated thoroughly before deduction.
4. **Generalization** the common element or fact deduced from specific instances is stated as a generalization, a rule, a definition, a principle, or a formula. The test of the success of the lesson is the ability of the student to state the generalization in their own words.
5. **Application** which tests the student's understanding of the generalization just developed. The student should be able to apply the generalization to other problems within the classroom setting and beyond.

Deductive method starts from generalization that is applied to specific cases. It begins with a generalization, rule, definition, concepts or formula; then individual cases are studied and examined to verify the generalization.

The steps are:

1. **Statement of the Problem** which should be stimulating and arouse a desire to solve it. It should be related to a life situation, real and vital, and within the ability and maturation of the student.
2. **Generalization.** Two or more generalizations, rules, definitions, or principles may be recalled. One of these will be the solution to the problem.
3. **Inference** which is choosing the generalization, rule or principle that will fit the problem. It may be through trial and error where one arrives at the right conclusion. It may be necessary to apply the generalization, rule or principle to a few cases.
4. **Verification** which is the trying out and securing the successful generalization, rule or principle, and in determining the validity of the inference by consulting recognized authorities such as the teacher, the textbook, the dictionary, encyclopedias, or other books. Accurate knowledge results from the emerging conclusion after verification.

SOME METHODS AND TECHNIQUES OF TEACHING PHYSICAL EDUCATION

LECTURE-DISCUSSION METHOD

The lecture discussion method is a teacher – centered method to help students understand or organize bodies of knowledge. It is more of exposition. According to Eggen and Kauchak (2001), its effectiveness is based on three theoretical sources:

1. It is intended to utilize what the students already know by building on their existing background knowledge,
2. Teachers present information in a systematic way which helps the students construct an organized understanding of the topic,
3. It uses teacher questioning to actively involve students in the learning process.

Stages of the Lecture-Discussion Method

I. Introduction

- Introductory focus (motivation)
- Lesson objectives.
- Overview takes two forms:
 - Lesson structure provides a means for identifying relationships among the major ideas (hierarchy, model, outline, matrix, etc.)
 - Advance organizer provides a link between old and new content. Visual representations are remembered longer than information only heard.

II. Presentation

III. Comprehension Monitoring – is the process of informally assessing student understanding and usually accomplished through teacher questioning.

IV. Integration – is the process of linking new information to prior learning and linking different parts of new learning to each other (Eggen and Kauchak, 2001).

V. Review and Closure

Review summarizes the topic, emphasizes important points, and provides

a link to new learning. It is most effective at the beginnings and ends of lessons.

Closure is a form of review that occurs at the end of a lesson, and it summarizes, structures, and completes the topic.

DIRECT TEACHING

Direct teaching is often appropriate in physical education. However, there are times when you can effectively guide students into discovering a point or an entire lesson for themselves.

Scenario: (Pangrazi, 1991)

- A common scenario would begin with the teacher explaining and demonstrating the skills to be developed.
- Students are then organized into partners, small groups, or squads for practice.
- The teacher gives a signal for practice to commence on the specific skills and then moves around the area correcting errors, praising, scolding, encouraging and so forth.
- The teacher gives a signal to stop, and the students gather around the teacher for a few final evaluative comments before moving on to the next activity.
- The teacher serves as the major demonstrator, lecturer, motivator, organizer, disciplinarian, director, and error corrector.

In teaching a folk dance, this strategy can be used to facilitate mastery of the figures of the dance. Aquino (1980) suggested a procedure in teaching a folk dance:

1. Make the class comfortably seated which may be in the formation of the

dance that is to be learned.

2. Introduce the dance by:
 - a. Giving the title of the dance,
 - b. Giving the background origin of the dance and the important facts, and values that can be associated with the learning of the dance,
 - c. Mentioning the time signature, counting, and the division of the music,
 - d. Showing the costume used in the dance (if possible) and stating the cultural nuances that are part of the costumes and accessories.
3. Let the students listen to the music, let them count, clap, or tap the rhythmic pattern while the music is being played.
4. Let the students stand up, and teach Figure I through the following procedure:
 - a. Instruct the students what to do. Give directions. If needed, demonstrate while analyzing the figure. Do not over verbalize.
 - b. Let the students learn the figure by the number. Cue and correct. Let the basics get through. Do not be overly concerned with style and form yet.
 - c. Dance the figure while counting rhythmically
 - d. Dance the entire figure with music.
 - e. Correct mistakes.
5. Teach Figure II, following the procedure 4.
6. Dance Figures I and II. Cue and correct.
7. Proceed teaching the rest of the figure, following the previously mentioned procedure.
8. Review the dance towards mastery and enjoyment. This time emphasize form and style. CUE and CORRECT. Encourage and praise, if necessary.

COMMAND STYLE (Follow the teacher)

Mosston's Command Style entails the teacher making all of the decisions concerning the content of the lesson and the learner or group imitating exactly what the teacher presents to them, and possibly responding as a group. Command style is teacher-centered. All the students have to do is to comply with the teacher directives and participate. The teacher gives movement cues, directions – the students follow. The teacher organizes the routine where the students comply. You may wish to use this approach if your objectives for the teaching episode are concerned with:

- Safety, discipline, conformity, uniformity and immediate response or replication of the teacher's model precisely and accurately
- A synchronized response
- Efficient use of time for acquiring skills.

TASK INSTRUCTION

The task style of instruction focuses on the specific tasks or performance. This strategy requires more preparation time for planning and designing tasks. Adequate facilities, equipment, and instructional devices are necessary to keep students productive and working on the appropriate tasks.

This style can be utilized with variety of grouping patterns. Students may work alone, with a partner, or in small groups. With large classes, limited amounts of equipment, or with certain skills in which partner can time, count, record, or analyze the skill work, the partner or reciprocal grouping pattern can be used.

CONTRACT (INDIVIDUALIZED) INSTRUCTION

This is a more sophisticated form of task instruction. In this style a specific

external reward system is attached to the accomplishment of the task, and this arrangement increases the motivational level of the students. The tasks are arranged progressively so that they increase in difficulty. This type is especially effective with physical activities that require the development of individual skills.

INQUIRY INSTRUCTION

Inquiry model of instruction is process-oriented rather than product-oriented. Students experience learning situations in which they have to inquire, speculate, reflect, analyze, and discover. The teacher guides and directs students, rather than commanding or telling. The teacher is responsible for stimulating the students' curiosity about the subject matter to enhance their involvement. The teacher uses a combination of questions, problems, examples, and learning activities to lead students toward one or more final solutions.

PROBLEM-SOLVING

Problem-solving involves input, thinking/reflection, choice, and response. There are two ways to take a more child-directed problem-solving method: exploration and guided discovery. Although these critical-thinking, problem-solving methods take more time than the direct method, they are worth it because they bring the cognitive domain into play.

A. Guided Discovery

In guided discovery, the teacher asks questions to guide students to the one right answer to the problem, but never provides the answer. This process is called **convergent problem solving**. Through questions, the teacher helps the students converge on one right answer. Guided discovery allows the students to respond to challenges at their own developmental level and rate. Specific challenges and questions will vary according to the response elicited.

Problems vary from simple to more complex.

- Simple: What are the different ways you can bounce the ball and stay in your individual space?
- Complex: What could be the most effective ways to position and handle the feet while guarding an opponent in basketball?

B. Exploration

Exploration implies a degree of choice of response, experimentation, and exploration. Movement exploration makes use of unstructured movement, which aims towards the development of body awareness and efficient management of the body in a variety of situation. Any challenge results in a number of responses.

The emphasis on exploration is repetition and creation. Movement tasks specify a precise skill or movement. Exploration is an **open-ended or divergent problem solving process**. **Self-discovery** is a necessary and important part of learning

Teachers must encourage students to continue producing divergent responses, but the encouragement should take the form of **neutral feedback**.

The following steps may be followed:

1. Setting and presenting the problem. (no teacher demonstration is allowed)
2. Determining procedures
Cognitive values begin with an assessment of how one is to proceed in seeking the solution. Sub-problems may be defined.
3. Experimentation and exploration by the students. Self-direction is important and the teacher acts in advisory role, answering questions, helping, commenting, encouraging but not providing solutions. Sufficient time must be allowed for this phase.

4. Presentation/observation, evaluation, discussion

Students should be given the opportunity to rework their own solutions incorporating ideas from others.

The following indirect styles are alternative ways to critical thinking. The critical thinking examples progress through levels similar to Bloom's Taxonomy, eliciting higher and higher levels of thinking (Werner, 1995) Here are examples of alternative ways to address issues of critical thinking using the indirect styles.

1. Select

Travel around the gymnasium the step like weight transfer of actions. Each time you hear the drum, change the way you travel. . . Now each time you hear the drum, change the direction of your travel. . . Finally change both method of travel and direction when you hear the drum.

2. Classify

Today we are going to work on different ways to use our feet to travel as we move in general space. You may use only your feet to travel. Ready, go . . stop. Who can tell me one way? Yes. Walk, run (one foot to the other foot, alternating), Hop (one foot to the same). Can you try other ways? Yes, I see two to two (jump). . . .

3. Compare

Try bouncing the ball with stiff fingers and slap at it with your palm (made lots of noise). Now try pushing the ball down with your finger pads. Keep your fingers spread and try not to make any noise as you push the ball down to the floor. Which way seems to give you the most control?

4. Explain, Compare, Contrast

Try different rising and sinking actions. Vary the way you use time, force,

and effort. Make the way you raise different from the way you sink. Perform your sequence for a partner by taking turns. Then, compare and contrast your solutions. How were they the same? Different?

5. Sequence

Use a roll of your choice to smoothly link two balances.

6. Apply

I'm noticing that as you hit your forehand strokes, a lot of balls kind of pop up and go high into the air. Others often hit their ball down into the net. What can you do to change this and hit the balls over level but close to the net? How would this change your grip? Swing?

7. Analyze

Dribble a ball against an opponent in this space (15' x 40'). Start at the end and try to get to the other end without your opponent stealing the ball from you. How can you best protect the ball while dribbling down the court?

CREATIVE WORK

This technique requires rich background of the students on:

- Movement vocabulary
- Fundamentals of Movement such as:
 - ✓ Purpose: Why do I move?
 - ✓ Use of Space: Where do I move?
 - Directions
 - Levels
 - Air and Floor Patterns
 - ✓ Use of Body Parts: Why do I move?
 - ✓ Quality or Effort of Movement: How do I move?
 - ✓ Relationships: With whom do I move?

MOVEMENT INTERPRETATION

Imitation is the focus of movement interpretation. This can be in the form of characterization and dramatization. It may involve “moving as if...” and “moving like...”.

BASIC STRATEGIES IN TEACHING FITNESS CONCEPTS AND ACTIVITIES

1. Accommodating all students no matter ability levels or physical characteristics.
2. Ensure that your students know and understand the goals of each fitness lesson
3. During the lesson review key points.
4. Encourage students to think and physically respond when you check for understanding.
5. Incorporate visual aids whenever possible to reinforce fitness learning.
6. Repeat learning experiences throughout the year.
7. Create challenges to help students reach their goals.
8. Offer students actual physical activity and encourage it out of school by offering challenges and incentives.

PLAY-TEACH-PLAY METHOD is allowing student's time to play, then stop them to offer helpful feedback, refining their play, and return them immediately to play.

INTERPRETATION OF WRITTEN INSTRUCTION (Group Work)

- A. This requires the teacher's preparation of;
 - charts, containing the activity for each group or board work for each group
 - printed charts on:
 - standards for group work

- standards for group presentation
- standards for evaluation

- B. The number of groups should depend upon the activity or activities for the day, availability of leaders, equipment and facilities and readiness of the students for group activity.
- C. Written instruction for interpretation should be simple and suited to the reading vocabulary of students.

MASTERY LEARNING

Mastery learning is an approach to individual instruction to meet the individual differences allowing the students to progress according to his own rate. It provides the students all possible opportunities for learning up to a level of mastery.

The different steps are:

1. Diagnostic or pre-test (to determine weaknesses and strengths as well as entry behavior)
2. First meeting (mastery learning)
 - a. Set the goal or criterion
 - b. Teach
 - c. Try-outs (individually or with partner)
 - d. Formative test (to determine student progress and as basis for ability grouping). Students' achievements must be recorded in individual progress report card.
 - e. Assignment

The student is challenged to continue improving on the skill with added incentive of moving from one ability level to a higher ability level.

3. Second meeting (same skill for mastery)
 - a. Recall criterion or set the goal for the day.
 - b. Group work: Activities may vary but same skill is being mastered.
 - c. Presentation/observation, evaluation
 - d. Formative test (to determine progress)
 - e. Planning for the next activity. At this stage, mastery has already been attained

CIRCUIT TRAINING

This is a method whereby one or more exercise are repeated as many times as possible within a set time limit. It is an exercise program consisting of a number of stations which demands an exercise task which should contribute to the development of various parts of the body.

- A. Prior to circuit training, the teacher should;
 1. administer physical fitness tests to determine the weaknesses of the students,
 2. possess a rich background of the activities and experiences from which activities for the circuit program will be selected,
 3. prepare sufficient equipment and space for each station, and
 4. give sufficient instruction in the activities to be given so that the students can perform correctly at each station.
- B. Procedure;
 1. Determine the length of time to be spent for each circuit.
 2. Select the appropriate exercises which will give improvement on weaknesses revealed in each of the physical fitness tests.
 3. Determine the maximum number of repetitions for each exercise (if there is greater need for exercises improving arm strength, more repetitions or time to be given to arm exercises).

4. Set the training dose. This is the actual number of repetitions distributed into laps.
5. Complete the circuit. If a student can not complete the circuit within the set time limit, more time is given for said student to complete it. Record time spent.
6. After laps are completed within set time limit, work on overload by:
 - a. increasing the number of repetitions with the same time limit,
 - b. increasing the number of repetitions as well as the time limit, and
 - c. changing the activities to more demanding types.

ASSESSMENT/EVALUATION

Assessment is an indispensable component of all effective teaching including physical education. It plays four main roles in physical education.

1. It forces the teacher to focus on the individual student.
2. It gives the teacher necessary data to see how the class as a whole is progressing.
3. It offers the teacher valuable feedbacks on how he is doing as a physical educator and how his program is doing.
4. It can be a valuable teaching tool in itself.

Assessment areas:

1. Physical fitness tests measure each aspect of health-related fitness.
2. Psychomotor skill assessment includes specific tests of specific motor skills.
3. Cognitive assessment includes monitoring students' understanding of how to perform.
4. Affective assessment monitor students' social development and attitudes in the physical education setting.

Assessment strategies: Fitness testing, Knowledge tests, Journals, self-monitoring sheets, Rubrics.

Two types of evaluation pertain to students:

Process evaluation relates to the performance of general movement patterns with emphasis on correct technique. The form used to execute the movement is the point of focus rather than the outcome of the skill performed. **Product evaluation** focuses on performance outcome in terms of measurable increments of what learners accomplish.

Example:

If product evaluation is applied to fundamental ball skills, the concern is how far the ball is thrown and how many times it is caught without a miss. Process evaluation focuses on the quality of the throwing pattern and teaching the students proper form.

PHYSICAL EDUCATION ACTIVITIES	INSTRUCTIONAL STRATEGIES	ASSESSMENT
Movement Skills and Concepts	Problem-solving	Performance checklist, task sheet as a rubrics, multiple choice assessment, affective paper-and-pencil survey
Health-Related Physical Fitness and Physical Activity	General strategies (8 basic strategies in teaching fitness concepts and activities)	Physical fitness testing

Games	Practice and Play-teach-play method	Rubrics for movement skills and concepts as applied to games, written tests, and sharing of thoughts and feelings
Gymnastics	Demonstration, problem-solving	Smiley-face exit polls, written or oral surveys, journal entries to monitor feelings
Dance	Direct style (introducing new task in folk dance, social and other dances); Indirect (exploring creative dance possibilities);	Teacher, self, and peer assessment for psychomotor; short written test and poker chips for cognitive; and journal entries, smiley-face exit polls or affective questionnaire; performance evaluation or process evaluation
Sports skills	Individualized instruction for development of individual skills, Demonstrations, Direct instruction	Teacher, self, and peer evaluation, performance evaluation, and process evaluation

STRATEGIES IN TEACHING HEALTH EDUCATION

Earlier on Health Education strategies are classified into audio, audio-visual and visual. Recently, health educators have come up with another classification which includes values clarification strategies, verbal and discussion strategies, action-oriented strategies and strategies that use media for health instruction.

VALUES CLARIFICATION STRATEGIES

An excellent strategy to personalize health concepts is through the use of values clarification activities. By examining and clarifying values, children can be assisted in fostering positive health behavior.

When engaging in any value clarification activity, the teacher must allot sufficient time for students to assess their own feelings about the issue under examination. Students must also feel free to assess their values without fear of being ridiculed or forced to pay lip service to the opinions of others, including the teacher. Keep these points in mind:

1. Value clarification activities do not lead to one “correct” solution to a problem; they are open-ended. The purpose of these activities is to open the door to additional assessment.
2. As a teacher, you are a participant in the activities and a role model for the students
3. Every student has the right to decline from speaking without having to give a reason for declining. Respect individual feelings and keep the activity non-threatening.

Simple Values-Related Strategies - One of the simplest and most appropriate activities for younger students involve what is known as **shield activities**. The major objective of these activities is to assist children in identifying values they have. Each child is given a prepared form.

Decision Stories - Decision stories are open-ended vignettes that describe a values-related dilemma and ask students to suggest a course of action. The stories should reflect real-life circumstances and should be appropriate to the age level of the children. No easy answer should suggest itself in the story. But viable courses of action must be possible.

VERBAL AND DISCUSSION STRATEGIES

Following are several other discussion-oriented strategies that have proven effective in health instruction.

Brainstorming- Like values-clarification activities, brainstorming can be used to improve decision-making skills by having students generate many possible ideas concerning an issue. Freedom of expression and creativity are also encouraged.

Buzz Groups- Buzz groups are an effective strategy for examining specific problem. Generally, this technique is productive if students are mature enough to use the format. It allows for student participation in an atmosphere conducive to discussion. The buzz group strategy should not be overused, because too much small-group can lessen student enthusiasm. To use this approach, divide the class into groups of from three to five students. Have each focus on a specific problem that you have introduced and discussed so that the children will have knowledge base for their discussion. The chairperson must keep the discussion on the topic, and the secretary records the important points.

Case Studies- Case Studies are actual events that you can use in class for discussions. The decision story format blends itself well to the case strategy. Just substitute the actual event to the hypothetical one. Good sources for case study materials are health journals, newspapers, new magazines and television programs.

Debate- Debate focuses on the merits and problems associated with a proposed solution to a problem. Through the use of this technique, you can ensure that both sides of an issue are presented. Although debate can be used in the lower elementary grades, the strategy is more effective when used with older children, who are more articulate and better able to organize their thoughts for oral presentation. Students must also be able to work individually as well as cooperatively and in groups.

Committee Work - This technique allows small groups of students to research a topic of interest. Each group member has an opportunity to do in-depth research on the topic. The work must be closely supervised and structured. It is very important that each member of the group contributes to the project if it is to be successful.

Lecture, Group, and Panel Discussion - Discussion, in one form or another, is probably the most common technique used in education. Lecture- discussion is usually thought of as a lecture delivered by the teacher. However, this strategy should not be limited to one-way communication. Lecture discussion can be from teacher to student, student to teacher, or student to student. The technique should be a means for achieving two-way communication

Resource Speaker - Speakers can enrich many areas of health instruction. Possible resource speakers include doctors, nurses, police, and fire department personnel, nutritionists, and health researchers. When contacting a resource speaker, be sure to provide that person with information about your class, including grade and developmental level. In this way, a speaker is less likely to talk down to or over the heads of the children. You should also politely emphasize that the speaker stick to the specific topic to be examined, because some speakers are apt to deviate to a favorite cause or concern not in keeping with your instructional objectives. Suggest that the speaker use audio-visual aids, if appropriate, as this will heighten student interest. Also, ask the speaker to allot time for a question-and-answer session.

ACTION-ORIENTED STRATEGIES

A variety of action-oriented or student-centered strategies can be used to make livelier health instruction. These range from seatwork activities to field trips. Whenever possible, any strategy selected should help students discover concepts through action-oriented means. Strategies that incorporate at least two of the sens-

es can greatly facilitate learning. Listening is fine, but listening plus seeing, tasting, smelling, touching, feeling, and doing are better.

Dramatization - Plays and skits, role playing, and puppet shows are all effective dramatization techniques. Each of these strategies is an excellent way of allowing students to express their feelings. Thorough preparation and follow-up are essential, however, lest these activities be seen merely as fun, with the point of the exercise being missed.

Storytelling - as a strategy, storytelling is similar to dramatization. However, as the teacher, you are the active participant, and the children are onlookers. Nonetheless, this is an effective strategy for helping students identify positive health habits and for shaping attitudes. Using a flip chart or other visual aid can heighten the impact of storytelling although no props are needed for many stories.

Magnetic boards - Objects that will cling to the fabric can be placed on the board. Such boards are quite useful as aids in telling a story or developing a concept, because objects can be added or taken off during the presentation. The students, in developing their own stories or presentations, can also use these boards. Magnetic board is simply a sheet of metal to which objects can be attached by means of small magnets. Chalk can also be used to write directly on a magnetic board.

Crossword Puzzles - Crossword puzzles are useful seatwork devices for building vocabulary and reinforcing concepts. The teacher, the students themselves, or a computer-generated program can develop them. Commercial materials are also available. Crossword puzzles for younger students must be kept relatively simple.

Demonstration and Experiments - Demonstrations and experiments help make verbal explanations more meaningful to students. In a demonstration, the outcome should always be the same; in an experiment, the predicted outcome may vary.

Otherwise, the two terms mean much the same. These techniques are especially because they usually involve the sense of sight, touch, and hearing. They may involve other sense as well. Students are always interested in demonstration and experiments because these strategies help clarify what has been learned.

Exhibits - Exhibits allow students to view, examine, and touch health-related materials. Exhibit is most effective when the students help in the design and construction. Careful planning is essential, as is a central theme. Always ask yourself: What is the point of the proposed exhibit? Your answer will provide a focus question for the children, too. If the actual objects are unavailable or are impractical for classroom display, pictures can be substitutes, although they are not as effective. Everything in an exhibit should be clearly labeled. If sound and motion can be added, student interest will be increased. Use your imagination to make the exhibit as visually appealing and interest-provoking as you can.

Models and Specimens - Like exhibits, models and specimens allow students to take a multi-sensory approach to health-related topics. The values of models and specimens lies in their degree of accuracy. Many excellent models of body parts are available commercially. These include models of the human eye, heart, lungs, and other organs. Another useful model is resuscitation Annie, a functional model used to teach mouth-to-mouth resuscitation. Specimens can be obtained from biological supply houses. These include tissue samples, animal eyes, and so forth. Commercial slaughterhouse can also supply some of these items. Exercise discretion in the use of specimens. For some children, such exhibits can be too grisly and models are better employed.

Field Trips - Field trips can provide rich learning experiences. This strategy must be used sparingly, however, because a field trip is time-consuming and often expensive. Further, parents and administrators must give their approval for any activity outside the school, and liability must be considered. A field trip should always be a

culminating activity rather than an introductory one. Children should be well prepared for the experience through prior classroom instruction. If the field trip is to be of value, the students must be able to understand what they will be seeing. Good places for health-related field trips away from the school include the local health department, a dairy farm, a food processing plant, or a sewage treatment facility. There are also many opportunities for field trips without leaving the schools area. Games- games can stimulate interest while providing review of concepts learned through other strategies. They are also sometimes a welcome relief from the normal classroom routine. In addition, games especially help younger children understand the importance of following rules and provide useful experience in socialization. Many commercially available games such as Bingo can be adapted to health-related topics. Or you may wish to

THE USE OF MEDIA IN HEALTH INSTRUCTION

Educational media include everything from textbooks to videotape to computer-assisted instruction. For the present purposes, the term will be defined as any non-print vehicle used for instructional intent. Such media include computers, television and videotape, films, filmstrips, slides, overhead transparencies, and records and audiotapes. Always remember that instructional media are not strategies themselves, but they serve as valuable approaches for involving students in the learning process and for enriching the classroom.

Computer-Assisted Instruction - The first attempts to employ computers in the classroom were made in the 1960s. A programmed instructional format was generally used, that is, instructional information was provided by the computer in small increments. By responding to questions asked about the material by the computer, the students learned the material and received immediate reinforcement. Programmed instruction, with or without the computer as a vehicle, can be an effective educational tool, but rigid structure and format often lead to student boredom. This

is exactly what happened in the 1960s. Additionally, the computers of that time were too expensive and impractical for common classroom use.

Television and videotape - Most school systems have access to television receivers. Many fine health-related programs, designed with elementary school child in mind, are available. These include “Bayani”, “Sine Eskwela”. “National Geographic” and various special programs.

Films - In considering films for instructional devices, keep in mind that a film should not serve as a sole basis for instruction and that every film must be carefully chosen and previewed.

Slides - like filmstrips, slides are colorful and are easy to store. If you make your own slides, the subject matter can include class activities and field trips, health fairs, environmental problems in the community and class projects. An advantage in using a slide is that you can delete or add slides to the sequence as you desire. In this way, you can keep your slide collection updated.

Transparencies - transparencies are extremely popular as teaching tools. One unique feature of a transparency is the ability to show a progression by using a series of overlays.

Records and Tape Recording - selectively used, records and tape recordings can be valuable teaching tools. Both are inexpensive and can be stopped anytime as needed for discussion.

The teaching strategies mentioned are not necessarily exclusive and to be an effective teacher one must have the ability to switch, mix and blend them to suit

your objectives for each teaching episode. Never view a single strategy as just one way of teaching a particular lesson. Decide what you want to achieve and choose the most suitable approach for achieving that objective.

Therefore in developing a repertoire of teaching approaches and the teaching skills to support them is only a part of being an effective MAPEH Teacher. Always remember that: “The real effective teacher is aware of **when** to use which strategy and with **what** type of students; and knows when to change a strategy, if it doesn't appear to be working”.

PART II – ANALYZING TEST ITEMS

ON PHYSICAL EDUCATION

1. When you include the physical fitness levels, physical skills, knowledge, socio-emotional behaviors, and attitudes toward the activity in your teaching style, it means that you are analyzing the style of teaching in terms of –
 - a. Teacher planning and set up
 - b. Student behavior during the lesson
 - c. Teacher behavior during the lesson
 - d. Student outcome variable

The answer is **d** (Student outcome variable) because option a (Teacher planning and set up) includes lesson plan, organizational arrangements or instructional devices while option b (Student behavior during the lesson) includes activity time, waiting, receiving information, management time, and so forth and option c (Teacher behavior during the lesson) includes instructions, questions, management cues, feedback, and demonstrating.

2. A direct teaching activity that allows students to imitate from demonstration or infer from observation the behavior to be learned.
 - a. Lecturing
 - b. Discovering
 - c. Modeling
 - d. Inquiring

The answer is option **c** (modeling) because option a (Lecturing) is an activity where facts, rules, etc. are directly provided, no demonstration is involved while option b (Discovering) is a cognitive activity that allows the students to seek answer to the problem and option d (Inquiring) allows students seek answers for their curiosity.

3. After discussing the parts of the body that are important in making movements, Miss Garcia proceeded to the next activity for her to find out how aware her students are with their body. “Find a way to make your body crooked”, she said. There were many elicited responses. This teaching style is a type of-
 - a. Guided Discovery
 - b. Movement Interpretation
 - c. Creative Work
 - d. Exploration

The answer is **d** (Exploration) because option a (Guided discovery) can elicit a single answer while option b (Movement Interpretation) focuses on imitation that can be in form or characterization or dramatization and option c (Creative Work) is a technique where students will be creating meaningful movements out of the basics.

4. For the station approach in a task style of teaching, the following are considered, EXCEPT-
 - a. Use task cards and tape them on the wall or to boundary cones or place them on the floor.
 - b. Give a copy of the tasks on a sheet of paper to take them to each station.
 - c. The tasks should cover all the basic skills of an activity.
 - d. Give an in-depth lecture on the tasks, and then proceed to the activity.
5. In using the convergent style of teaching, which of the following is a complex problem?
 - a. What are the different ways of tossing the volleyball to your spiker?
 - b. How can you make your back as close as possible to the floor with your legs on the air?
 - c. What is the best offensive solution when a defender is playing a very tight defense in basketball?
 - d. In shot put, what is the best angle of release for maximum distance?

6. Ms. Lopez was successful in dealing with exploration when she taught movement skills in her class. When asked how she did it, she answered "I took advantage of the students' love of movement experimentation and allowed among them the free exercise of natural curiosity. Above all, I avoided something that will lead them to imitation and noncreative behavior." What did Ms. Lopez avoid?
 - a. Encouraging, clarifying, and answering questions individually.
 - b. Demonstrations and praising results early.
 - c. Motivating efforts, since the student is responsible for being self-directed learner.
 - d. Offering the students opportunity for self-direction in small doses.
7. Which of the following subject matters can creative work be applied?
 - a. Folk dance
 - b. Interpretative dance
 - c. Social dance
 - d. Square dance
8. After all the physical activities have been done in the class, Mr. Robles assessed the affective learning of his students. Which of the following assessment procedure did Mr. Robles possibly use?
 - a. Journal entries to monitor feelings
 - b. Paper-and-pencil test
 - c. Peer assessment
 - d. Performance checklist
9. If the physical education teacher is assessing the students' ability to skip with a mature movement pattern, he is using –
 - a. Physical fitness test
 - b. cognitive assessment
 - c. Psychomotor skill assessment
 - d. Affective assessment
10. What is the responsibility of the physical education teacher in an inquiry instruction?
 - a. Helps the students converge on one right answer.
 - b.. Stimulates the students' curiosity about the subject matter to enhance their involvement.
 - c. Explains and demonstrates the activity.
 - d. Command and tell students to imitate.
11. Miss Regala allowed time for her students to play games, upon observation she stopped them to offer helpful feedback and refined their play strategies, and she let them return immediately to play. Miss Regala applied the-
 - a. Creative work
 - b. Command style
 - c. Mastery Learning
 - d. Play-teach-play method
12. Mr. Samson is assessing the step-by-step sequence of underhand serve of his students. What appropriate assessment can he use?
 - a. Peer assessment
 - b. Performance assessment
 - c. Process assessment
 - d. Self assessment
13. When you assess how the students understood the movement concepts, you employ –
 - a. Written test
 - b. Affective paper-and-pencil survey
 - c. Performance checklist
 - d. Task sheet as rubrics

ON HEALTH EDUCATION

- 14 The following are postulates of successful teaching EXCEPT
 - a. The most important factor in the educational process is the teacher
 - b. There is no one best way to teach
 - c. Adherence to the diagnostic/prescriptive approach is essential
 - d. The most important factor in the educational process is the student

The correct answer is D. The other 3 options are all assumptions of successful teaching except for option D which pertains to the beneficiary of the teaching process.

15. As a health educator, Miss Cruz is in-charge of the school clinic the absence of a school nurse and physician. She gives first aid to students and teachers who encounter minor injuries, sends students to the nearest health center when needed, and assists the MAPEH teachers in appraising the nutritional status of the students by taking their height and weight. Which role of Miss Cruz was not mentioned as a part of the school health team?
- | | |
|---------------|-----------------|
| a. Counseling | c. Referrals |
| b. Screening | d. Coordination |

The correct answer is A. Option B, C and D are roles clearly described in the above situation.

16. Mr. dela Cruz is planning to demonstrate the ill effects of cigarette smoking to a person's health. Which of the following strategy is best suited to achieve his objectives?
- | | |
|--------------------|--------------------------|
| a. Shield Activity | c. Dilemma |
| b. Experiment | d. Open-ended statements |
17. Verbal and Discussion –Oriented strategies have been proven effective in health instruction except for topics in
- | | |
|--------------------|--------------------|
| a. Family Planning | c. First Aid |
| b. Drug Education | d. Consumer Health |
18. Teacher Joyce is using socialized recitation to motivate students to speak out their views about early marriage. When she called Mario to stand-up

and give his view, he stuttered. Teacher Joyce did not give up and waited until Mario was able to give his view. The interval between asking a question and the student's response is referred to as

- | | |
|--------------|-----------------------|
| a. directing | c. commenting/pausing |
| b. probing | d. wait time |

19. A group of students are planning to address the garbage problem in their community. During their brainstorming several measures were suggested by all the members. Soon after, they divided the work among themselves to accomplish the task. Which of the following techniques is illustrated in this type of activity?
- | | |
|--------------------------------|-------------------------------|
| a. limited exploration style | c. problem-solving style |
| b. unlimited exploration style | d. cooperative learning style |
20. Most school systems have access to educational television programs. These include "Bayani", "Sine Eskwela". "National Geographic ", and the like. To which type of Media instruction do they fall?
- | |
|----------------------------------|
| a. Television and videotape |
| b. Computer-Assisted Instruction |
| c. Records and Tape Recording |
| d. Films and slide |
21. Good places for health-related field trips away from the school include the following except
- | | |
|----------------------------|------------------------------|
| a. local health department | c. a food processing plant |
| b. resort facilities | d. sewage treatment facility |
22. To personalize health concepts, students must relate to health instruction from the affective domain. An excellent strategy for achieving this goal is through the use of
- | |
|--|
| a. verbal and discussion-oriented strategies |
|--|

- b. values clarification strategies
- c. action-oriented strategies
- d. use of media

23. The class of Mr. Reyes is composed of drop-outs and regular students whose age ranges from 16 to 30 years old. What could be a better way of organizing them for a team project?
- a. group them according to age so they can work well
 - b. let them select their own group so they will not have a problem
 - c. mix them in a group for cooperative learning
 - d. let them work as one group with the teacher as the facilitator
24. Miss Santos wants to reinforce health concepts through vocabulary building. Which of the following can she include as part of her activities?
- a. Bulletin boards
 - b. Lecture-discussion
 - c. Debate
 - d. Crossword puzzles
25. In order to present clearly the different systems of the body, which of the following can Teacher Tess prepare for her lecture?
- a. flip chart
 - b. specimens
 - c. overlays
 - d. exhibits

PART III – ENHANCING TEST TAKING SKILLS

ON PHYSICAL EDUCATION

1. The teacher directs the students, “Step right foot across the left foot in front, step the left foot close to the right foot, and step right foot in place!”. The student complied and participated.
 - a. Inquiry style of instruction
 - b. Exploration
 - c. Command style of instruction
 - d. Task style of instruction
2. When the physical education teacher uses problem-solving strategy dance class, his assessment may be in the form of –
 - a. Task sheet as a rubrics
 - b. Rubrics for movement skills
 - c. Performance checklist
 - d. Process evaluation
3. What are the appropriate assessments for gymnastic skills?
 - a. Physical fitness testing
 - b. Affective questionnaire
 - c. Sharing of thoughts and feelings
 - d. Journal entries to monitor feelings
4. When you give the students activities on movement, exploring the movement possibilities of “moving as if...” and “moving like...”, you are giving your students the opportunities for –
 - a. Mastery Learning
 - b. Movement interpretation
 - c. Movement exploration
 - d. Creative work
5. “Which way seems to give you the most control of the ball?”, “Use a roll of your choice to smoothly link two balances.”, and “How can you best protect the ball while dribbling down the court?” are some examples of an alternative ways to address issues of critical thinking when you use this

- style of teaching.
- a. Indirect style
 - b. Exploration
6. In this style a specific external reward system is attached to the accomplishment of the task, and this arrangement increases the motivational level of the students. The tasks are arranged progressively so that they increase in difficulty. This type is especially effective with physical activities that require the development of individual skills.
- a. Task instruction
 - b. Contract Instruction
 - c. Inquiry instruction
 - d. Problem-Solving
7. The physical education teacher employed this strategy by arranging her class with variety of groupings. She lets her students work alone, focusing on the specific task given. The students rotated through each learning station and work on the assigned tasks.
- a. Problem-Solving
 - b. Inquiry Instruction
 - c. Contract Instruction
 - d. Task Instruction
8. This teaching strategy is used by physical educators because they want to elicit synchronize response from the class.
- a. Task instruction
 - b. Inquiry
 - c. Command style
 - d. Exploration
9. This provides instructional strategies that encouraged the processes of generalization and discrimination for the purpose of forming concepts, patterns, and abstractions.
- a. Deductive Method
 - b. Direct Model
 - c. Inductive Method
 - d. Indirect Model

10. Mr. Beltran is developing the individual skills of his students. It is possible that he is using the-
- a. Individualized style
 - b. Problem-solving method
 - c. Guided Discovery
 - d. Movement Interpretation
11. When Miss Rodriguez wants her students to create dance movements, allowing them fully to discover for themselves dance patterns out of the learned motor skills, she is utilizing –
- a. Exploration technique
 - b. Problem-solving
 - c. Guided-discovery technique
 - d. Inquiry
12. What assessment will Mrs. Alonso use, if she wants to focus on performance outcome in terms of measurable increments of what her students accomplished.
- a. Process assessment
 - b. Product assessment
 - c. Written test
 - d. Performance checklist

ON HEALTH EDUCATION

13. When engaging in any value clarification activity the teacher must consider the following except:
- a. to allow the students to assess their own feelings about the issue under examination
 - b. to allow the students to feel free to assess their values without fear of being ridiculed
 - c. to teach own personal values or the “correct” values
 - d. to allow students to decline from speaking
14. Which of the following objectives is correctly stated in affective domain
- a. The student will be able to demonstrate positive attitude towards health

- situations
- b. The student will demonstrate an understanding of cooperation in a given situation.
 - c. The student will be able to develop positive self concept through relevant and positive experiences.
 - d. The student will be able to help others develop a desirable self-concept.
15. Which of the following is not true in the teaching of values in health education?
- a. Values are learned through a variety of experiences and interaction with the environment
 - b. A teacher's job is to impose his values on the student so that they will develop the values expected of them
 - c. Students will learn values when teachers provide factual information about health and allowing them to clarify their feelings
 - d. teachers can help students understand how information, attitudes and behavior affect quality of life
16. Which of the following does not belong to values clarification strategies used in health education?
- a. dramatization
 - b. educational games
 - c. decision stories
 - d. shield activities
17. The class of Mr. San Pedro is composed of irregular students whose age ranges from 14 -18 years old. What could be a better way of organizing them for a team project?
- a. group them according to age so they can work well
 - b. let them select their own group so they will not have a problem
 - c. mix them in a group for cooperative learning
 - d. let them work as one group with the teacher as the facilitator
18. Discussion strategies have been proven effective in health instruction except for topics in
- a. Family Planning
 - b. Drug Education
 - c. First Aid
 - d. Consumer Health
19. A variety of action-oriented or student-centered strategies can be used to make health instruction livelier. Which of the following best describes these types of activities
- a. These strategies help students discover concepts
 - b. The strategies incorporate at least two of the senses can greatly facilitate learning
 - c. These strategies include computers, television and videotape, films, filmstrips, slides, overhead transparencies, and records & audio-tapes.
 - d. These activities range from seatwork activities to field trips.
20. Teaching in content areas such as family life, drug education, and HIV education can be a difficult task. To avoid controversies and heated arguments on sensitive subject matters, a health educator must do the following except
- a. present an accurate and factual information
 - b. present results of studies obtained from health journals
 - c. present information from authorities in health
 - d. present religious beliefs, personal values and attitudes
21. Regardless of the strategy employed, the teacher must strive to create a classroom environment that is conducive for learning. the following are things that a teacher can do to facilitate a positive learning climate, EXCEPT—
- a. Identify instructional objectives and discuss them with the students so that the intent is clear concerning what is expected.

- b. give careful attention to the physical condition of the classroom.
 - c. Show familiarity with evaluation devices, instruments and techniques.
 - d. Handle disciplinary problems with tact and good judgment.
22. One of the simplest and most appropriate values-related activities for younger students is the Shield Activity. Which of the following describes the correct procedure?
- 1. Have the students fill out the shield.
 - 2. Thoroughly introduce the experience.
 - 3. Carry out the task.
 - 4. Go over the experience.
- a. 2,1,3,4
 - b. 1,2,3,4
 - c. 2,4,3,1
 - d. 3,1,4,2
23. Teacher Stephanie invited the school physician to talk about sensitive topics on reproductive health. In contacting the resource, the following information must be provided by teacher Stephanie, EXCEPT –
- a. The audio-visual aids to use for the lecture.
 - b. The time allotted for the open forum for the question & answer session.
 - c. Information about the class including the developmental level.
 - d. the specific topic to be discussed.
24. Computers have great potential in the teaching of health education. However, there are concerns of which the teacher must be aware such as the availability of the computer in the classroom, the high cost of software and the incompatibility of different systems. Which of the following is not true pertaining to the use of computer assisted instruction?
- a. The development of personal computers and CD-ROMs has led to an increasing use of computers in the classroom.
 - b. Computer instructional programs tend to make use any of the six types which include drill and practice, tutorial, demonstration, simulations, instructional games, and problem solving.
 - c. The Computer Assisted Instruction helps make verbal explanations more meaningful because they involve senses.
 - d. One of the benefits of CAI is the student involvement in the selection and evaluation of information.
25. Which of the following can assess the health practices of the students?
- a. Objective type of test
 - b. Inventory checklist
 - c. practical test
 - d. Demonstration

Organization and Management of Physical Education and Health

Prepared by:
Dr. Salve Andes-Favila

Competencies:

1. Relate concepts of organization and management on different areas, issues/concerns of PE and Health activities
2. Apply competition and officiating techniques
3. Recognize legal liabilities
4. Manage the budget and funding requirements in competition

PART I - CONTENT UPDATE

Key Concepts

- **The School Physical Education Program.** The total physical education program encompasses the three well-developed, coordinated and integrated aspects of instruction, intramural and interschool programs.
- **The Coordinated School Health Education Program** includes Health Services, Health Instruction, Healthful Living and School-Community Coordination.
- **Management.** The process by which key personnel provide leadership so that the organization functions efficiently and effectively in achieving the goals for which the organization exists.
- **Management skills** include technical, human, conceptual, political, and leadership skills that take into account various philosophical and theoretical underpinnings of management. These skills, combined with the appropriate measure of knowledge, sound judgment, experience and training will prepare the temporary manager to effectively lead any program or organization as well as to achieve success and satisfaction.

A philosophy of management for Physical Education and Sport should recognize that the needs and welfare of the people who make up the organization are paramount to success.

Becoming an effective manager will depend on the level of knowledge and understanding the manager has of the multidisciplinary approaches available in

dealing with business and human resource issues, the degree to which the manager can implement this skill and the manager's ability to exercise entrepreneurial strategies.

Management Functions

- Program Planning/Development
- Organizing
- Leading
- Controlling
- Staffing
 - Human Resource and Management Supervision
 1. Recruitment, selection, retention, and promotion
 2. Orientation of new staff
 3. Supervision
 4. Evaluation
- Facility management
 1. Site
 2. Building
 3. Lighting
 4. Environmental climate
 5. Plant sanitation
 6. Acoustics
- Fiscal Management
 1. Budgeting
 2. Budget Management
 3. Financial Accountability
- Purchase and Care of Supplies and Equipment
 1. Selection of Supplies and Equipment
 2. Purchase of Supplies and Equipment

3. Checking, storing, issuing and maintaining supplies & equipment
 4. Risk Management
- Evaluating

Principles for Management and Structure

- The management structure of an organization should clarify the delegation of authority and responsibility.
- Management work maybe most effectively organized by function
- Span of control should be considered in organizational structure
- Successful management depends on communication
- Coordination and cooperation among various departments in an organization are necessary for effective management.
- Staff or task specialization aids effective management
- Duties and rights of personnel
- Authority must be commensurate with responsibilities, and lines of authority must be clearly drawn.
- Organization and social purpose cannot be separated
- There is no single correct form of organization

Line and Staff Organization

The most common type of organizational chart is a line and staff. A person in a line position has direct responsibility and authority for a specific objective or objectives of the organization. A person in a staff position has an indirect relationship to a specific objective of an organization.

Formal and Informal Organization

Organizational theory and structure require that there must be a need for an organization to exist, and second, the organization must know the goals it is trying to achieve. To accomplish these objectives, a structure should be provided that

enables the management to plan and make decision, organize, staff, lead, motivate, control and evaluate. These tasks can be performed through either a formal or an informal organization.

THE SCHOOL PHYSICAL EDUCATION PROGRAM

I. Physical Education Instructional Programs

The above figure shows the traditional view of the relationship between the basic instructional or physical activity program, recreational sports and varsity athletics.

By tradition, the basic instructional physical education program was graphically represented at the base of an isosceles triangle. The part immediately above the instructional base was the recreational sports program, and at the apex of the triangle was the varsity athletic program. What the isosceles triangle symbolized in the past is still true to the effect that a sound physical education program should serve as a solid base for all other school and community physical activity and sport programs. The instructional program in physical education is the place to teach skills, strategies, concepts, and essential knowledge concerning the relationship of physical activity to physical fitness, motor skill, cognitive, and affective development. It is a place to challenge, build competence, encourage creativity, promote lifelong activity, advance critical action skills, instill commitment to personal wellness, and foster respect for others. It is also a place to introduce an awareness of the development and maintenance of optimal levels of health-related physical fitness.

Skills should be taught from a scientific, theoretical, and progressive approach so that the various mediators and human factors that affect human movement are clearly understood by the participant. Demonstration, videotapes and videodisks, computers, posters, workbooks, and other audiovisual aids and materials enhance instruction and are useful for optimal learning.

The physical education program presented throughout the school years should be sequential in development and progressive in application. A physical fitness program should also be developmental and progressive in nature, as well as personalized, starting with the individual's present state of mental and physical fitness and gradually moving to higher levels.

Performance objectives should be established and targeted for individual student progress achievement. When boys and girls advance from one grade to another, they should have achieved certain objectives in various physical education activities, just as they achieve various levels of skills, knowledge, and competencies

in other school subjects. A plan for assurance of mastery or graduation standards in physical education must be developed and implemented.

Physical education should involve more than physical activity. As the participant understands more fully the importance of human movement; what happens to the human body during exercise and stress; the relationship of physical activity to one's biological, psychological, and socio-cultural development; the history of various activities; and the role of physical activity in the interdependent global community, physical education will take on a new meaning, grow in intellectual respectability, and contribute to building a more healthy and productive society.

A Preschool Physical Education Programs

- The concept of early schooling is no longer regarded as a custodial or compensatory undertaking.
- It is viewed as a necessary provision for the normal growth and development of children.
- Child development specialists and sociologists has indicated that the early years are crucial for the child intellectually, physically, socially, and emotionally.
- The return of many mothers to the workforce, nursery schools and child day-care centers has gained wide popularity.
- Programs should involve indoor and outdoor play-learning activities.
- Physical education activities should include the development of fundamental movement skills, fitness, self-testing and team-building activities, creative free play, and rhymes and story plays.
- Programs are becoming an integral part of educational systems in this

country, and physical education should play an important role in such programs.

B. Elementary School Physical Education Programs

- Physical education takes on important part of the schools' instructional program and is designed to foster development of fundamental motor skills, health-related fitness, and knowledge and attitude relative to physical activity through a carefully planned curriculum that includes.
- Learning experiences help students understand how to move and to become more aware of their body within the environmental framework of force, time, space, and flow.
- Physical education at this level should promote the individual child's standard of motor performance and establish a physical activity comfort level so that each child develops an appreciation and enjoyment of movement.
- Physical education should foster creativity, challenge, self-expression, social development, team building, positive self-concepts, and appreciation for the importance and value of health-related fitness.

C. Secondary School Physical Education Programs

- The secondary program should be based on the developmental tasks of secondary school students.
- The program should consist of a variety of age-appropriate activities, including gymnastics, self-testing activities, rhythm and dance, movement skills, aquatics, physical fitness activities, outdoor education, and individual dual and team sports.

- The program should provide a thorough understanding of the human body and the impact of physical activity on its various organic systems.
- The program should teach variety of skills progressively, eliminate excessive repetition of activities, and ensure the inclusion of lifetime sports and health-related fitness concepts.
- The program should be open to all students, including those with varying disabilities, who should be provided an opportunity to function in the least restrictive environment.
- The program should encourage vigorous physical activity in and outside of class, including individual fitness and participation in community, recreational, and varsity sport

II. Intramural

- The intramural program is concerned with the provision of recreational activities and athletic competition for all students within a school
- It gives all students an opportunity to develop the athletic skills they have been taught in the instructional program.
- Its organization may be based on the educational level, size of the school, school philosophy.
- At the elementary and secondary level most intramural/recreational programs are directed by the physical education department
- At the college and university level there are varied organizational relationships. Some intramural/recreational programs are organized to function as departments in schools or colleges of physical education.

Others are organized attached to the office of the dean of students or vice president for student affairs. In some universities, this activity is operated as a separate entity or as part of the athletic department.

Units and Types of competition

1. Unit of Competition

- Inter-class
- Grades
- Age
- Height
- Clubs
- Societies
- P.E. Classes

2. Types of Competition

- Single Elimination.** The type of tournament used when there is a big number of entries or players but short playing days. This type is the easiest to handle because a team or player that loses once is automatically eliminated.
- Double Elimination.** This type of tournament allows the team/player to stay in the competition until it loses twice.

DOUBLE ELIMINATION FORMAT (DIAGRAM)

4 Teams

No byes

No. of games = $(N-1) \times 2 = 6$

- c. **Round Robin.** The most effective type of competition where each team/ player will have a chance to meet all teams or players who entered the competition.

5 Teams

3 Byes

No. of games = $(N-1) \times 2 = 8$

6 Teams

1 Byes

No. of games = $(N-1) \times 2 = 12$

- d. Ladder. Lower rank players have the chance to climb the ladder provided they win over the player occupying the higher step of the ladder.
- e. Pyramid. This type of tournament is similar to single elimination but it is designed in a vertical manner in the diagram.

III. Interschool Program

It is concerned with the provision of competition for the most highly proficient students in the various sports with teams from other institutions.

IV. Physical Education for the Handicapped Child

- The concept of "Mainstreaming"
- Least Restrictive Environment
- Special Olympics

Administrative Practices for the School Health Program

The aim of the school health program is the development of optimum physical, mental, emotional, and social health among all pupils. A checklist of administrative practices which can serve as a guide to the administrator in the accomplishment of this aim is outlined by Anderson and Creswell:

1. Recognize health as a basic objective of education.
2. Secure and budget adequate funds for the health program.
3. Keep parents informed of the health program.
4. Establish an appropriate cooperative relationship with community health agencies.

5. Maintain communication with community organizations.
6. Employ qualified school health service personnel.
7. Become informed about health problems of the school-age group.
8. Arrange the school day in accord with sound health practice.
9. Establish an effective system for keeping health records.
10. Establish a policy on school health examinations.
11. Provide for health observations by the teachers.
12. Establish a systematic referral program.
13. Promote measures to ensure corrections for every child.
14. Establish program policies aimed at control of communicable diseases.
15. Procure necessary materials, facilities, and equipment for health instruction.
16. Provide time and facilities for health instruction in the secondary school.
17. Appoint only qualified teachers for health instruction.
18. Provide a healthful physical environment.
19. Provide a mentally hygienic environment.
20. Establish a school safety program.
21. Provide facilities, personnel, and an established plan to meet emergencies.
22. Provide health services for professional personnel.
23. Provide in-service health education for teachers.
24. Provide for faculty sick leave

School–Community Coordination

- Every school must have a physician who will function as a school medical adviser.
- There must be someone in each school who has a definite responsibility for the total school health program. This individual is known as the health counselor or health coordinator.
- The director of physical education is frequently the health coordinator.
- Educators have associated physical education closely with health values and objectives.
- The physical educator is in a strategic position to perform excellent service.
- The coach and the physical education teacher come into close informal contact with the students and thus can gain understanding of their health problems and needs.

The Scope of the School Health Program

Health Instruction

The fundamental purpose of health instruction is to equip the student with sufficient knowledge about health to enable him to attain and maintain both in attitude and practice, the highest possible level of health.

Basic Principles of Health Instruction (Anderson and Creswell)

1. Emphasis is on the positive aspect of health.
2. Health is an end to be gained, not only an academic subject.
3. Instruction is directed to the well, or normal child. Children temporarily below par will be benefited by the health practices acquired by the whole class.
4. Throughout the school life, health, health promotion should be one of the objectives of the whole school program.
5. Learning experiences must be adapted to the physiological, psychological and social development of the children.
6. Instruction must be based on student's interests, needs, abilities and backgrounds.
7. Learning results from experience, and opportunities must be provided for experience through participation, doing things, and reacting to situations.
8. Problem solving provides the most effective learning situation.
9. Learning experiences are most effective when the child sees the relationship of one experience to the whole experience.
10. The objectives of the activity must always be specified in terms of learner outcomes and must be recognized as personal goals of the child if learning is to be effective.

11. Instructional activities must be always related to the actual experiences of the learners.
12. Learners must be helped in making generalizations and in applying these generalizations to various new experiences.
13. Integrative learning is most effective.
14. Repetition or drill is justified when the learning must be precise and is useful as a tool or skill.
15. Each child is unique, learns at his own rate and his own way, and thus a variety of activities and materials is essential.
16. Accompanying incidental learning always takes place and teachers should be alert for opportunities to make each learning experience yield greater returns in learning.
17. Health work in the school cannot be fully effective unless integrated with the life of the home, community and the forces in which both can contribute to the child's education.

School Health Services

The service program embraces the various protective measures assumed by the school to conserve and improve the health of students. the health services vary considerably in different institutions, but the minimum essentials of a good program include the following activities.

1. Health Appraisal
 - a. The periodic medical examination
 - b. The periodic dental examination
 - c. Psychological examinations

- d. Screening tests
 - e. Teacher-nurse observation
2. The follow-up program
3. Communicable disease control
4. Emergency care procedure
5. Health Supervision of school personnel
6. Student excuses

Healthful School Environment

Healthful school living is a more inclusive term, to be preferred to those that formerly designated this phase of school health education. This term refers to the entire environment that surrounds the pupil. It not only involves safe and sanitary facilities but also includes careful planning of the school day for study, play, and rest. Since teachers are also part of the school environment, the establishment of healthful teacher-pupil relationships is an important aspect of healthful school living.

School-Community Coordination

An effective strategy for promoting the health of school-age students is the development of collaborative efforts between the community agencies and the school. These coalitions can coordinate and advocate for improving the various aspects of the comprehensive school health program.

PART II – ANALYZING TEST ITEMS

1. Mr. Abando, the head of the Physical Education Department, is planning for the forthcoming School Intramurals. To ensure the success of the program he met with all the faculty members and invited key people from the other departments, some staff and school administrator to chair the working committees. Which of the management functions is being illustrated in this situation?
A. Planning
B. Organizing
C. Evaluating
D. Staffing

The correct answer is Option **D**. Mr. Abando has identified people to head the different committee based on their ability to do the work. Option A and B were functions done ahead of time by the department head; Option C is still to be done after the implementation of the activity.

2. San Pedro High School accepted Allan, a blind student in the regular PE class. Allan is very good in following directions that is why he can cope up with the lessons in gymnastics and dance. If the PE teacher allows Allan to play Volleyball which of the following is the best way do to?
A. Modify instruction
B. Modify activity
C. Modify equipment
D. Modify rules

The correct answer is Option **D**. The teacher may allow Allan to serve the ball and be substituted at once to allow continuity of the game so as not to deprive normal students of the regular game process. Options A, B, and C may only benefit Allan at the expense of all the regular students in the class.

3. Performance evaluation should determine the extent by which the employee is contributing to the overall mission of the organization. This evaluation is crucial in providing information into the organization's reward and punishment system. Which of these is not true about performance evaluation?
A. Employees themselves must refrain from participating in the evaluation process
B. Evaluation helps members to grow in the job
C. Evaluation to be relevant must be centered on agreed-upon job performance criteria.
D. Evaluation result aids management in the promotion of qualified employee

The correct answer is Option **A**. Evaluation is a cooperative venture and members must be included in developing criteria for evaluation because they need to understand the process. Options B, C, and D are goals of good performance evaluation

4. In order to accommodate twenty teams for the school intramurals in two days, which of the following may help the Committee on Games accomplish the task best?
A. Use Ladder type of game scheduling
B. Use Single Elimination
C. Use Double Elimination
D. Use Round Robin
5. Which of the following management functions does the manager performs when he creates a shared culture and values, creates a shared communicating goals and instilling among employees the desire to perform at a high level?
A. Controlling
B. Planning
C. Leading
D. Organizing

6. This management function requires certain types of steps to be followed to bring about meaningful course of action.
 - A. Problem Solving
 - B. Coordinating
 - C. Decision making
 - D. Innovating
7. Physical Education and Sports Programs spend thousands of pesos on supplies and equipment in order to provide a meaningful and varied program of activities. Because a large expenditure of funds is made for supplies and equipment, it is important that the management responsibilities be carried out in a business-like manner. Which of the following statements best describes this management responsibility?
 - A. Supplies and equipment needs must be accurately determined
 - B. Purchase must be conducted within organizational policy
 - C. Storage, maintenance and repair of items must be considered for longevity of use
 - D. Selection must be accomplished according to sound judgment.
8. Which of the following best describes the principles in the organization of comprehensive school health services in the public school setting?
 - A. Every school must have a physician who will function as a school medical adviser
 - B. The Physical Education Department Head is frequently the health coordinator
 - C. The coach and the physical education teacher come into close informal contact with the students and thus can gain understanding of their health problems and needs.
 - D. The physical educator is in a strategic position to perform excellent health service.
9. The fundamental purpose of health instruction is to equip the student with sufficient knowledge to enable him to attain and maintain both in attitude

and practice the highest possible health. Which of the following is one of the basic principles of health instruction?

- A. Throughout the school life, health and health promotion should be one of the objectives of the whole school program
 - B. Instruction must be done in the vernacular language to enable the students to relate to the concepts and health principles
 - C. Learning experiences must not be prejudicial to community beliefs, taboos and cultural differences
 - D. Normal and differently-abled students must be considered in the preparation of the curriculum
10. For the full implementation of the comprehensive school health education program, which of the following plays a vital role in the absence of personnel, facilities and equipment of any public schools in the Philippines?
 - A. Teacher-nurse coordination
 - B. School-community coordination
 - C. School-health center coordination
 - D. Teacher-community health worker coordination
 11. Organizational design is the deliberate process of configuring processes, reward systems, practices and policies to achieve the organization's goals. Which of the following words is used incorrectly to mean organizational design?
 - A. Physical Plant
 - B. Structure
 - C. Organization
 - D. Framework
 12. Any school needs an organization that is dynamic to respond to the changes in the internal & external environment. To ensure success, the following characteristics must be present in the management of the organization except
 - A. Active Leadership
 - B. Knowledge of Management
 - C. Commitment of members
 - D. Re-designed framework

13. The current emphasis on equal education has helped to focus attention on children with special needs. Physical Education can offer solutions to relevant problems through any of the following except
 - A. Organizing activity-oriented programs
 - B. Implement initial screening for classification
 - C. Counseling of Parents
 - D. Parental Involvement
14. Common problems of school administrators in implementing school sports program includes all of the following except
 - A. Providing qualified coaches
 - B. Inadequate facilities and equipment
 - C. General supervision of the program
 - D. Sustainability of the program of activities
15. Class management skills are pre-requisite to instruction. Moving and organizing students quickly and efficiently requires all of these except
 - A. The teacher's comprehension of various techniques
 - B. Students' effective acceptance of the techniques
 - C. Adjusting what to be learned to the needs of the learner
 - D. Organizing students into groups and formations
16. The students of teacher Flor are preparing the write up of the result of the health survey in the community. The best way to disseminate the information in the various sector of the barangay is to:
 - A. Prepare flyers to be distributed to households
 - B. Submit written report to the barangay chairperson
 - C. Present the result in an assembly
 - D. Coordinate with the barangay to hold a meeting for that purpose
17. If PE supplies and equipment are inadequate per class per session, which of the following could be the best option for a teacher to do in order to ensure proper conduct of the class?
 - A. Adapt instruction for the time being
 - B. Improvise equipment for the teaching of basic skills
 - C. Divide the class into smaller groups to take turn in the use of equipment
 - D. Ask students to bring their own equipment
18. Program organizers find the management of behavior to be the most difficult task in any of school activities. Which of the following best describes effective behavior management?
 - A. Reprimand children who break the rules
 - B. Allow students to participate without encroaching on the rights of others
 - C. Develop an action plan for modifying and maintaining desired behavior
 - D. Use praise and facial expressions to acknowledge desired behavior
19. A relatively small amount of money is needed to operate an intramural program. Which of the following can be the best procedure to ensure the success of the activities without so much budgetary allocations?
 - A. Use of minimal entry fee from the participating team.
 - B. Use of Physical Education class equipment
 - C. Request administrative support for the activity
 - D. Get the amount from the athletic fee of the students.
20. This management process requires that certain steps be followed to bring about meaningful actions.

A. Planning	C. Leading
B. Organizing	D. Decision Making

21. Which of the following least describes the characteristics of a good leader?
- Leaders are individuals who are inventive, who takes the risks, and who are entrepreneurial
 - Leaders provide vision of potential and promise, and they possess the ability to attract, mobilize, and energize others
 - A good leader tends to influence burnout people to function best in a structured work in a dynamic, creative environment
 - A good leader helps shape personal philosophies of management, management style and decision-making.
22. A leader who provides guidance but leaves the decision making to the group to solve the problem is practicing which type of management style?
- Laissez-faire
 - Authoritarian
 - Democratic
 - Eclectic
23. For the selection of best athletes, which of the following types of game scheduling is best to use when time, budget and venue permits?
- Double elimination
 - Round robin
 - Single elimination
 - Double round robin
24. Students must be involved in as many roles as possible in the organization and management of school intramurals in any of the following except as;
- Record/score keepers
 - Managers
 - Officials
 - Team Captain
25. The following are extramural competitions except:
- Inter-department competition
 - Inter-school competition
 - District Meet
 - Division Meet

PART III – ENHANCING TEST TAKING SKILLS

- Management functions include all of the following except
 - Planning
 - Organizing
 - Implementing
 - Coordinating
- The fourth year students are organizing the intersection competition. There are four sections competing so they have agreed to use double elimination. What is the formula for double elimination?
 - $(N-1) \times 2$
 - $(N \times 2) \times 1$
 - $N(N-1)$
 - $2N(N-1)$
- A student teacher was tasked to organize the health exhibit for the foundation day. In order to facilitate the work, he requested a group of students to work with him. He gave them specific committee to chair and the time table to finish the task. To ensure that each committee's task is accomplished on time he placed the Gantt Chart in the conference room. What management functions are described in this situation?
 - Planning and Organizing
 - Staffing and Monitoring
 - Coordinating and Budgeting
 - Directing and Evaluating
- At the beginning of the school year, the health teacher is tasked to help the school clinic in taking the height and weight of the students during PE time as well as the tests for vision and posture during Health Education time. What specific function of the school health services is delegated to the MAPEH teacher?
 - Health Inspection
 - Health Screening
 - Health Appraisal
 - Health Evaluation
- As part of the health team, the health educator does the following functions except?
 - To organize the community for health education

- B. To refer the sick child to the nearest community health center in the absence of doctor or nurse
 - C. To refer the malnourished/ undernourished child to the home economics department for feeding program
 - D. To organize the first aid team and be part of the safety council
6. Which of the following can be the best option for a MAPEH teacher in organizing a PE class for instruction which consist 60 students
 - A. Use of film clips/video
 - C. Group or peer approach
 - B. Collaborative approach
 - D. Demonstration teaching
 7. Which of the following is tolerable during a group activity
 - A. Noise coming from the discussion
 - B. Movement of students from one group to another.
 - C. Going out to buy the things needed for the group work
 - D. A number of students not participating in the group activity
 8. To ensure the successful conduct of the cheering competition as a culminating activity in PE 1, which of the following can be done to start and end the program on time?
 1. Preparation and dissemination of the program and invitation to all participants
 2. Preparation and dissemination of the criteria for judging
 3. Preparation and dissemination of the sequence of performance
 4. Preparation and dissemination of the guidelines for the culminating activity
 - A. 1,2,3
 - C. 2,3,4
 - B. 1,3,4
 - D. 1,2,4
 9. To allow special students to showcase their talent and skills in sports and dance, which of the following can be done by the sports department?
 - A. Allow special students to perform & compete with the normal students
 - B. Prepare a special program and competition for them
 - C. Allow the special students to compete in special Olympics
 - D. Prepare a program that will allow them to join the regular students
 10. Which of the following does not belong to the unit type competition?
 - A. Inter-class
 - C. Club
 - B. Age
 - D. Event
 11. The function of choosing the entire personnel, assigning people, training and maintaining favorable conditions for all members of the organization refers to
 - A. Staffing
 - C. Coordinating
 - B. Controlling
 - D. Planning
 12. This management function ensures the proper execution of plans. It also means that subordinates must be kept informed through regular reports, research, monitoring and evaluation concerning performance
 - A. Leading
 - C. Staffing
 - B. Controlling
 - D. Organizing
 13. A leadership style which is described as having democratic approach and needed only a little guidance where decision-making is left to group members.
 - A. Authoritarian
 - C. Eclectic
 - B. Democratic
 - D. Laissez-faire
 14. It is the skill of influencing the activities, situations, perceptions, and expectations of an individual or group in an effort to have them willingly strive for a common purpose of the organization.
 - A. Decision-making
 - C. Leadership
 - B. Policy-making
 - D. Advisorship
 15. It is the most common organizational structure where the person has direct responsibility and authority for the specific objectives of the organization
 - A. Formal
 - C. Line and Staff
 - B. Informal
 - D. Hierarchical

16. An example of a short term budget is
A. Annual budget C. Operational budget
B. Fiscal budget D. Capital outlay
17. If a legal issue does arise, seeking advise from the school, institutional or association legal counsel or hiring a private attorney is recommended. Which of the following term is synonymous to lawsuit, court case or legal action ?
A. Litigation C. Asset
B. Liability D. Tort
18. This term means to twist. It is a legal wrong resulting in direct or indirect injury to another individual or property.
A. Litigation C. Asset
B. Liability D. Tort
19. Which of the following formula is used for double elimination?
A. $(N-1) \times 2$ C. $(N+1) \times 2$
B. $N \times (1-2)$ D. $(N-1) \times 4$
20. The following are responsibilities of supervisors except
A. Exercise authority vested in his position
B. Establish effective means of communication
C. Support the total program
D. Provide leadership and promote staff
21. Which of the following program goals should not be supported by the physical education and sport management support?
A. Provide a meaningful psychological experience
B. Develop health-related and motor-performance related fitness
C. Develop skill in a wide-range of physical activities
D. Provide avenue for understanding and appreciation of physical activities and sport.
22. Organizing the community for health literacy could start with any of the following except
A. A community health survey on the needs of the people in the community
B. Ocular visit of the identified community
C. Planning with the barangay officials
D. Meeting with Non-government and civic organization
23. To ensure sustainability of the health extension program of the National High School in the community of informal settlers, which of the following is the best option of the organizer?
A. Train potential leaders in the community
B. Establish linkages with the Go and NGO for long range adoption
C. Skills training of all sectors for vocational and technical courses
D. Attract foreign aid for sustainability
24. Which two statements are true in the intercollegiate sports program in the Philippines in the desire to win
1. Unethical recruitment procedures
2. Provision of sound educational programs for athletes
3. Provision of Individualized Education Programs for Persons with Disabilities
4. Fielding athletes who have high academic standing
A. 1 and 2 C. 2 and 3
B. 1 and 4 D. 2 and 4
25. The comprehensive Individualized Education Program (IEP) for special students can be developed using team approach. The following persons may be included in the team except
A. Teacher-coordinator C. Social worker
B. Classroom teacher D. Physical therapist

Health Practicum

Prepared by:
Dr. Salve Andes-Favila

Competencies:

1. Roles and Responsibilities as Health Officer

PART I - CONTENT UPDATE

- The philosophy of Health Education is emphasized as an essential foundation for building educational programs that can influence positively people's health, knowledge, attitudes and practices.
- Philosophy implies wisdom regarding the principles of reality and of human nature. These principles act as guidepost to the development of the health education programs that work through identifying goals and areas of practice.
- The philosophy of Health Education includes the history, knowledge, beliefs, concepts, attitudes, and theory of the health education profession.
- Health Education philosophy sets the boundaries of educational practices, clarifying the areas of professional concentration; it is the matrix of theory and practice that culminates in healthful attitudes and behavior and results in improved health status.

QUALITY OF THE HEALTH EDUCATOR AND ADMINISTRATOR: PRE-EDUCATION and POST-EDUCATION	QUALITY OF ORGANIZATION AND ADMINISTRATION OF THE HEALTH PROGRAM	QUALITY OF PROGRAM DEVELOPMENT IN HEALTH EDUCATION	QUALITY OF TEACHING AND LEARNING METHODS, STRATEGIES AND TECHNIQUES	QUALITY OF PROGRAM EVALUATION AND ADAPTATION
--	--	--	---	--

PHILOSOPHY AND PRINCIPLES OF HEALTH EDUCATION

- The meaning of health education has taken on new meanings throughout the

years. The committee on Health Education Terminology (1991, 103) stated that the health education process is the “continuum of learning which enables people as individual members of social structures, to voluntarily makes decisions, modify and change social conditions in ways which are health enhancing”-(Green and Kreuter, 1995)

- Health promotion is defined as the aggregate of all purposeful activities designed to improve personal and public health through a combination of strategies including:
 1. The competent implementation of behavioral change strategies
 2. Health education
 3. Health protection measures
 4. Risk factor detection
 5. Health enhancement
 6. Health maintenance

The historical development in health and health education are categorized according to certain period:

Period	Characteristics
• Egyptian health practice from primitive to 1000B.C.	Personal cleanliness
• Hebrew Health Code, about 1500 to 500 B.C.	Formulation of a health code to include personal cleanliness and public health measures
• Greek approach to health, about 1000 to 200B.C.	Emphasis on the sound body
• Roman Health Promotion about 100 B.C. to A.D.500	Sanitary engineering

• Asceticism (Dark Ages), about 400 to 1000	Spiritual development
• Revival of the concept of the sound body, about 1096 to 1248	Return to a sound body
• The pre-modern period of health, about 1500 to 1800	No unified health program
• Modern Era of health, about 1850 to the present	Odor-free environment, bacterial cause of disease, promotion of health, public health education, and other advancements in hygiene and the health sciences. The modern era is further subdivided into the • The Miasma Phase (1850-1880), • The Bacteriological Phase (1880-1920), • The Positive Phase (1920-1960) and • The Social Engineering Phase (1960-present)

The Coordinated School Health Program

- **Healthful School Environment.** This aspect of the school health program includes the physical and psychological environment in which student and faculty exist. Issues include the social and emotional environment of the classroom, the development of self-worth and self-esteem, and the fostering of positive relationships for students and school personnel. In addition, safety hazards on the school grounds and within the buildings are of concern.

- **School Health Instruction.** This area of the school health program includes the information presented to students in a way that fosters desirable health knowledge, attitudes, and practices.
- **School Health Services.** These programs seek to promote children's health through screening, intervention, and remediation of various health conditions. The school nurse most often coordinates and provides the services. Screenings for visual or auditory problems, scoliosis as well as first aid procedures, illness protocol and services for the handicapped are part of these services.
- **School Physical Education.** A comprehensive physical education program is one that offers a daily program of activities. These programs should be based on developing wellness among school-age students
- **School Nutrition and Food Services.** This component involves training the food preparation personnel and developing nutritionally sound food programs for the school. Part of this component is helping children to select nutritionally balanced meals ensuring that food served in the school cafeteria is nutritious, palatable and attractive.
- **School-Based Counseling.** This aspect of the program seeks to meet the needs of the children by providing services such as assertiveness, problem-solving and self-esteem training. Services are also provided by a school psychologist for children experiencing learning difficulties and behavioral problems.
- **School site Health Promotion.** Programs for faculty and staff can provide benefits by reducing health costs, improving morale and increasing productivity.

- School, Family, Community Health Promotion partnership. An effective strategy for promoting the health of school-age children is the development of collaborative efforts between community agencies and school. These coalitions can coordinate and advocate for improving the various aspects of the comprehensive school health program.

The Health Educator

Responsibilities

1. **Assess individual and community needs for health education.** The emphasis is placed on the identification of factors that are most likely most responsible for unfavorable health behaviors within a particular group such as peer pressure, and cultural and religious factors.
2. **Plan effective health education program.** The health educator needs to be able to develop a detailed plan for the most effective use of educational resources.
3. **Implement health education programs.** Once an educational plan has been completed, the health educator needs to be able to present and describe the program to groups such as local school board who would approve the plan.
4. **Evaluate the effectiveness of the health education programs' competency.** The health educator needs to be able to demonstrate the effectiveness of health education program that has been planned and implemented.
5. **Coordinate the provision of health education services.** Many health education programs involve many people and are often based within larger organizations. Both of these characteristics require the health

educator in various settings to assist and encourage personnel in carrying out the educational aspects of the health education program

6. **Act as a resource person in health education.** The health educator should be able to collect and organize general information to meet routine requests and should become aware of community resources for referring more complex requests.
7. **Communicate health and health education needs, concerns, and resources.** Health educators should be able to communicate many different types of messages involving different types of media. Bear in mind that these messages will need to be communicated to a wide variety of individuals and groups

- **Qualities**

The following is a list of characteristics and actions that will help one become a quality health educator

1. **Stay Motivated.** The best teachers are, always have been, and always will be, those who have worked hardest to motivate their students. Motivation is as important a part of any teacher's teaching as any part of their lesson plan. One cannot overstate or over estimate the effect of motivation on the level of intensity of a student's performance.
2. **Be Organized. Good organization is a habit.** Teachers should understand that there are no shortcuts to success. Practice organization and attention to details.
3. **Be Consistent in relation with students.** This doesn't mean that you have to treat all students alike. Students have the right to fair and equitable treatment, attention and discipline. Treat all of them with dignity and respect.
4. **Refrain from giving negative opinions to students.** This sometimes happens when a teacher pays attention to teacher's lounge gossip. When a teacher prejudices, the student will never have a chance.
5. **Find time to listen to students.** Communication is a two-way street. Never be too busy to listen to your students. Genuine communication does not always require words; it grows out of mutual sense of concern for others.
6. **Show care, love, and concern to students.** Teachers should not be involved in the personal lives of their students. However, they must deal with problems in students' personal lives that affect their performance in class.
7. **Be a success yourself. Success is 1% inspiration and 99% perspiration.** Successful people invest in themselves. Attend seminars, read a lot, consult with others and continue schooling. Good luck comes from hard work.
8. **Be Positive.** Positive thinking and unswerving dedication to make a dream a reality will provide the incentive to carry through whatever hard times and negativism on the part of the others that lies in your part. A teacher can't quit during the hard, frustrating times. Remember that change is normal and inevitable.
9. **Seek role models.** Benefit from others. Teachers usually have a teacher in their past that inspired them. Drive yourself to meet new challenges and set new goals
10. **Set goals.** Outline your goals clearly. Concrete goals are easily understood by you and by your students. Set goals and develop a plan to achieve those goals.

11. **Work hard.** The road to success is never easy. To succeed, work hard.
12. **Stay updated.** No matter how well you are doing what you are doing, you can do it better by exposing yourself to interests and ideas outside your immediate day-to-day activities.

The Health Educator as part of the Health Team

- **Legal Responsibilities as a Teacher**

1. “Loco Parentis “in the place of parents”. One major concern of today’s teacher is liability. Negligence can be charged when students are under the teacher or school’s supervision.
2. The primary responsibility of the teacher is to act responsibly to prevent injury to students. A health teacher must be aware of first aid and emergency procedures in order to care for a student and not to aggravate an existing injury or illness.
3. Follow the school system’s procedure for filing a report for each accident.

- **Working with Students**

1. Counseling students in health-related matters. One of the teacher’s responsibilities is counseling student in health-related matters. Counseling should be straight forward, and free from moral judgment, preaching or scare tactics. In the role of counselor, a teacher must develop good listening skills and communication skills.
2. Teaching Health Education

- **Role model behavior through lifestyle Working with Parents**

1. Notify a student’s parent when an illness or serious deviation from normal health occurs
2. Follow school policy on parent notification
3. Invite administrator to sit in a teacher-parent conference. Explain to parents the significance of the child’s health condition, and encourage them to obtain needed care for the student.
4. If parents ask for guidance in seeking care, refer them to proper agency or person. Follow up any case reported to parents.

- **Working with Other Teachers and School Administrators**

1. Keep teachers and administrators informed of health matters related to the community and students
2. Represent the school in health-related committees of teacher-parent and community organizations.
3. Plan the Health Education curriculum and make recommendations regarding the health education program
4. Work closely with the administrators when notifying parents about child’s health referring parents to appropriate health resources and following up on student cases.

- **Working with the School or Clinic Nurse**

1. Help the school nurse understand the health behavior of students
2. Assist nurse in the screening of students

3. To refer students who are in need of screening
4. Conduct in-service workshops for other faculty members
5. Can be a member of the disaster brigade

- **Working with Other Agencies**

1. Promote health education and awareness in the community
2. Can volunteer to educate the community on health matters
3. Involvement in the local public health programs by providing services to the students and community

Summary

- Health education has evolved from a diverse background
- The nation's emphasis on health education has in turn, led to a need for effective educators
- As an effective educator, a health teacher must concentrate on academic preparation and personal qualifications
- Teaching health is different from other disciplines in the curriculum.
- Teachers must be aware that they are modeling health behavior to students through their lifestyle.
- There are several barriers to successfully implementing health education.
- Teachers can overcome these hindrances by keeping their knowledge up-dated.

- Educators who model good health behavior have a positive impact on their students.
- Several specific characteristics and actions will help a teacher become a quality educator.
- Teamwork with parents, school nurse, the school physician, administrators, community organizations and students is the key to a successful school health program.
- As a part of the health team, the teacher
 1. Is aware of his/her legal responsibilities
 2. Observes each student for any deviation from normal health
 3. Reports to proper authority within the school
 4. Is available to refer the student and parent to appropriate community resource or to counsel the student and/or parent concerning the student's health

PART II – ANALYZING TEST ITEMS

1. Health teachers play important role in the health assessment of students. In addition to their skillful observations, they have access to a variety of health information concerning each student. Which of the following records provide a rich source of background and current information that can be useful in promoting good health and identifying potentially handicapping situation?
 - A. Class Register
 - B. Permanent Health Record
 - C. Annual Medical Examination Record
 - D. Health Screening Record

The correct answer is **B**. option A contains data on age, sex, absences and the years in school of the child; Data on option C and D are already consolidated in the Permanent Health Record.

2. In order to help the school-age child to function very well while at school, the school health team is tasked to monitor their health status as part of their routine work. The following are members of the school health team except:
 - A. Nurse
 - B. Health teacher
 - C. Parent
 - D. Barangay Chairman

The correct answer is **D** since the Barangay Chairman is not a member of the school community. The rest of the options are members of the school community.

3. Jennie's health teacher has recently become concerned about her ability to see. He has noticed that he looks very closely to the instructions on the

board and most of the time bumps into objects inside the classroom and in the corridors. Which of the following is the best way that the teacher can do to help Jennie with her problem?

- A. Use Jenny's record on visual acuity for referrals
- B. Call for a conference with the parents regarding the problem
- C. Refer Jennie to the nearest health center
- D. Send Jennie to the school clinic for referral

The best answer is D. As the health teacher, Jenny's teacher can use her screening result to refer Jennie immediately to the clinic for proper referral measures. Option A is also correct but as a health teacher, he must know Jennie's health status after the screening test. Option B can be done by the school clinic personnel and option C is the duty of the school doctor or nurse.

4. All of the following are some uses of the student's health record except for
 - A. Coordinating services
 - B. Research
 - C. Medication
 - D. Developing intervention program
5. Stephanie Rani, age 16, refuses to drink milk or eat vegetables except corn and carrots. What methods are available for Teacher Joyce to evaluate the nutritional adequacy of her diet?
 - A. Biochemical assessment
 - B. Dietary assessment
 - C. Anthropometric assessment
 - D. Wellness assessment
6. While playing basketball in the gymnasium, Marlu shouted for help as he fell on the floor. Teacher Ivy immediately ran to the site to see what happened. She saw that Marlu was in pain and pointing to his left ankle. Unluckily, there

- was no nurse on duty. The nurse comes only on Fridays. What is the best way to help Marlu?
- Shout for help and give first aid
 - Bring Marlu to the nearest health center
 - Call for the parents
 - Carry Marlu to the hospital
7. Poor health practices and habits are responsible for many of today's health problems. The Health Education subject offered in the Basic Education Curriculum somehow helps improve the overall quality of the student's health. This component of the Comprehensive School Health Education Program is better known as:
- Health Promotion
 - Health Services
 - Health Instruction
 - Health Coordination
8. Involving parents in school's safety education program encourages consistency of information and practices. This aspect of the Comprehensive School Health Education Program pertains to
- School site Promotion
 - School, Family, Community Health Promotion
 - School Health Services
 - School Health Counseling
9. Teaching healthy eating practices taught in school can benefit students from childhood to adulthood but because of other lifestyle a number of health problems are now thought to be directly or indirectly related to food in-take. The following are food-related problems except:
- Dental carries
 - Obesity
 - Cardiovascular disease
 - Lung cancer
10. As a health education teacher and member of the school health team, teacher Sheryl is responsible for the following except
- To act as "Loco Parentis"
 - To act responsibly to prevent injury to students
 - Assume the role of a clinic personnel when there is no doctor available
 - To Follow school system's procedure in reporting/filing report of incidence
11. Who among the members of the school health team provides assistance with mathematical calculations of the nutritional values of foods, recipes and menus in the school canteen?
- school nurse
 - home economics teacher
 - dietician
 - canteen manager
12. Filipino children typically eat meals that contain too few _____
- meat products
 - vegetable products
 - fruits
 - milk products
13. Vitamins are organic substances derived from living substances that are required in small amounts to maintain life. Vitamins do not provide any calories but are essential for a variety of roles, from the processing of nutrients to the formation of red blood cells. The 13 vitamins are categorized as either fat-soluble or water-soluble. Which of the following is fat-soluble?
- Vitamin B12
 - Vitamin C
 - Vitamin A
 - Vitamin B6
14. Which of the following is NOT a component of School Health Program?
- Health Instruction
 - Health Protection & Prevention
 - Healthful Environment
 - Health Services
15. What could probably be the best reason why smoking in public places is prohibited?
- The cigarette butts could become a litter that will plug the drain age.

- B. It contributes to air pollution.
C. It should be done in closed places like the home.
D. Its secondary smoke is bad for the health of people nearby.
16. What food group can a health teacher suggest to very active students in order for them to be provided with heat and energy?
A. Vitamins
B. Protein
C. Carbohydrates
D. Minerals
17. Labels can help consumer compare and evaluate health products especially on drugs because
A. it gives the prices
B. it tells about the ingredients
C. it tells about the possible side-effect
D. it includes the expiration date
18. One of your students have been advised by her doctor to take antibiotics for her skin disease. But because she was so busy doing school works, she forgot to drink one after lunch. What would you suggest to her?
A. Shift to a much higher milligram for much effective effect.
B. Stop taking the medicine anyway you failed to follow the frequency
C. Double the dosage in the evening
D. Take one right away and adjust the frequency of medicine intake
19. Proper waste management starts in the home for health and sanitation. What is the process if discarding waste materials can you share with the people in the community so that they can be used again?
A. Ecology
B. Recycling
C. Garbology
D. Composting
20. In your community extension work, you were tasked to lecture on cancer warning signals. Which of these is not a cancer-warning signal?
A. nagging coughs
B. indigestion or difficulty in swallowing
C. post natal dip
D. change in bowel movements
21. Republic Act 9275 otherwise known as Philippine Clean Air Act aims to protect the country's bodies of water from pollution. What primary agency can your school or community linked with to help you with your ecological problem?
A. DOH
B. DENR
C. Dep ED
D. DPWH
22. Which of the following is most closely referred to as an environmental crisis resulting from high increase in the rate of population growth?
A. Malnutrition
B. Migration
C. Pollution
D. Irrigation
23. If a person is pale and has a faint pulse after an accident, first aid should include.
A. having the person stands still
B. having the person lie down
C. giving a stimulant like alcohol
D. having the person move around
24. Health Appraisal could be done by the _____ in the absence of the doctor
A. Health Education Teacher
B. Guidance Counselor
C. Dentist
D. Music Teacher
25. Watching students work and play provides the teacher with many clues about potential health problems. This screening tool is known as
A. Health Observation
B. Health Inspection
C. Health Screening
D. Health Assessment

PART III – ENHANCING TEST TAKING SKILLS

1. Daily health inspection provides opportunity for informal health education. Health educators can help students develop awareness of their own health through simple questions about many topics such as the following except
 - A. "Did you brush your teeth this morning?"
 - B. "Do you wash your hands before and after eating?"
 - C. "Does your neighbor observe traffic rules and regulations?"
 - D. "Do you throw your trash in the waste can?"
2. Compared with other components of MAPE/H, Physical Education is particularly vulnerable to accidents and injuries due to negligence. Negligence is defined by the court as conduct that falls below a standard of care established to protect others from unreasonable risk or harm. Which of the following describes a kind of negligence that occurs based on the lack of action of the teacher in carrying out a duty.
 - A. Nonfeasance
 - B. Contributory Negligence
 - C. Torts
 - D. Liability
3. The following are postulates of successful teaching health except
 - A. The most important factor in the educational process is the teacher
 - B. There is no one best way to teach
 - C. Adherence to the diagnostic/prescriptive approach is essential
 - D. The most important factor in the educational process is the student
4. The kind of evaluation that is concerned with how far, how accurate, how many, how much and how fast. This usually makes use of checklists, anecdotal records, self-evaluation and standardized tests

A. process evaluation	C. content evaluation
B. product evaluation	D. context evaluation
5. To personalize health concepts, students must relate to health instruction from the affective domain. An excellent strategy for achieving this goal is through the use of
 - A. verbal and discussion-oriented strategies
 - B. values clarification strategies
 - C. action-oriented strategies
 - D. Use of media
6. Which of the following is not true about healthful school living
 - A. provision of safe and healthful physical plant
 - B. good interrelationship among the students, faculty and staff
 - C. comprehensive curriculum
 - D. well-maintained school health services
7. How can Teacher Joyce best introduce the proper way of brushing the teeth in one remote community where most students have no toothbrush and money to buy toothpaste?
 - A. proceed with the lecture using pictures
 - B. use salt and twigs of any available edible plant
 - C. demonstration using soap and the index finger for brushing
 - D. individualized instruction for those who brought their toothpaste and toothbrush
8. The Health class of Mr. Reyes is composed of drop-outs and regular students whose age ranges from 16 to 25 years old. What could be a better way of organizing them for a team project?
 - A. group them according to age so they can work well

- B. let them select their own group so they will not have a problem
C. mix them in a group for cooperative learning
D. let them work as one group with the teacher as the facilitator
9. Some of your students would come in incomplete uniform. How are you going to encourage them to wear the prescribed P.E. uniform?
A. tell them it's a requirement
B. give them additional grade
C. tell them the health and hygienic reason
D. tell them the safety reasons
10. Which of the following strategies is no longer appropriate in the teaching of health concept for fourth year students?
A. dramatization
B. debate
C. Values clarification
D. Puppet show
11. The following are possible sources of stress among students except
A. separation of parents
B. frequent headaches
C. birth of a brother or sister
D. death in the family
12. Which of the following is not nutrition -related issue for athletes
A. fast food craze
B. junk food culture of students
C. gain-lose height-weight promo
D. propaganda advertisement
13. The following are characteristics of quackery except
A. that it offers of guaranteed, quick cure for an illness with a "miracle" drug or treatment.
B. it underrates traditional medical practice
C. that it does not use surgery
D. that it uses devices, gadgets, researches to convince patients that their illness is cured
14. Which of the following objectives is correctly stated in affective domain
A. The student will be able to demonstrate positive attitude towards health
B. The student will demonstrate an understanding of cooperation in a group work.
C. The student will be able to develop positive self concept through relevant and positive experiences.
D. The student will be able to help others develop a desirable self-concept.
15. In teaching people in the community, health workers use demonstration to help explain meaningful concepts to students because they involve other senses. The following areas are appropriate for their use except
A. teaching of family planning
B. teaching of first aid
C. teaching of nutrition
D. teaching of drugs
16. As a health educator, teacher Mary plays a vital role in any of the following except
A. Referral of sick students to the school doctor
B. Counseling of problem students
C. Active role in the safety council of the school
D. Manning the clinic in the absence of a nurse or a doctor
17. Which of the following can help a health volunteer identify the breeding place of mosquitoes in the barangay where the school is located
A. Ocular inspection
B. Household Survey
C. DOH report
D. Students' report

18. The common cause of fainting among public school students is:
- A. Missing breakfast
 - B. Hunger
 - C. Poor school environment
 - D. Extreme weather condition
19. During earthquake or fire drill, the teacher must
- A. Be the first to leave to lead the students
 - B. Be the last to leave to clear the area
 - C. Go with the students
 - D. Be left in the area
20. Students are always reminded to follow school rules and regulations. Which of the following are commonly violated that may pose danger to one's life
- A. Bringing of cellphone
 - B. Bringing deadly weapons
 - C. Bringing drugs
 - D. Joining fraternity
21. Extension programs of the school are usually conducted in the community. Which of the following can be the extension program of first year high school students for their health class
- A. Clean and Green
 - B. Peace and Order
 - C. Family Planning
 - D. Drug Free Environment
22. As member of the school health team, the school administrator's role is
- A. To monitor the school health instruction
 - B. To see to it that the school has a complete medical personnel
 - C. To ensure the provision of the health services
 - D. To convene the health council
23. Which of the following is the main reason why students are encouraged to wear complete PE uniform during PE day?
- A. For personal hygiene
 - B. For safety
 - C. For conformity
 - D. For easy identification
24. Who among the members of the health team can best help students who suffer from depression due to failing grades
- A. Health teacher
 - B. Subject teacher
 - C. Guidance counselor
 - D. Peer counselor
25. Parents who are members of the health team may help in which of the following concerns?
- A. Follow up and home visitation
 - B. volunteer for the health center
 - C. volunteer for peer group facilitators
 - D. Coordinate school program with the barangay

Special Education

Prepared by:

Dr. Salve Andes-Favila

Competencies:

1. Identify the legal bases for special education
2. Relate theories and principles of teaching in handling special students in the mainstream
3. Classify special students
4. Apply approaches in handling differently-abled persons in Physical Education and Health
5. Utilize the fitness and health needs of special students in the preparation of Individualized Education Program in PE and Health Education
6. Evaluate the fitness

PART I - CONTENT UPDATE

Definition of Terms

- **Autism** - is a complex developmental disability that typically appears during the first three years of life. It is characterized by extreme withdrawal and communication difficulties.
- **Behavior Disorders** - are characterized by inappropriate school behavior. It includes a wide range of disabilities. Most severe are psychotic and schizophrenic individuals.
- **Cerebral Palsy** - refers to several non- progressive disorders of voluntary movement or posture that are caused by malfunction of or damage to the developing brain that occurs before or during birth or within the first few years of life.
- **Curriculum Adaptation** - is an important component of adapting materials for instruction. This is done by joint planning of by the special education teachers and the general education teachers.
- **Disability** - refers to inability or a decreased capacity to perform a task in a specific way.
- **Exceptional Children** - refer to individuals who differ from societal or community standards of normalcy due to significant physical, sensory, cognitive, or behavioral characteristics.
- **Gifted** - exceptional students with intellectual gifts or special abilities and talents in areas such as the arts, sports, and leadership.

- **Handicap** - refers to the impact or consequence of the disability, not a condition itself.
 - **Hearing Impairment** - the handicapping condition characterized by an impairment in the ability to hear.
 - **Individualized Education Program** - a plan developed to meet the special learning needs of each student with disabilities.
 - **Least Restrictive Environment** - the most appropriate educational placement that is closest to the mainstream.
 - **Mainstreaming** - involves the practice of placing children with disabilities into classes with able students.
 - **Mental Retardation** - deficient mental functioning measured in terms of intelligence quotient. Mildly retardation (IQ ranging from 52-68), Moderate retardation (IQ ranging from 36-52), Severe retardation (IQ ranging from 20-36), profound retardation (IQ under 20).
 - **Neuromotor Impairment** - an abnormality of or damage to the brain, spinal cord, or nerves that send impulses to the muscles of the body. This often results to motor problems that can affect several body systems.
 - **Orientation** - the ability to determine one's position in space.
 - **Programmed Instruction** - the method of instruction in which learners progress at their own pace through small incremental steps that provide immediate feedback about response accuracy.
 - **Physical and Health Disabilities** - include students with physical impairments and those with medical conditions that result in chronic health problems.
 - **Screening** - is the process that involves all students in a school setting and is part of the "child-find" process. In most situations, screening tests may be administered without parental permission and are used to make initial identification of students who may need special services.
 - **Slate and Stylus** - a small hand-held device used to write Braille.
 - **Special Education** - is a customized instructional program designed to meet the unique needs of an individual learner.
 - **Special Class** - a class in which students with special needs are grouped together in a self-contained class.
 - **Special Students** - students with special learning needs who require instructional adaptations in order to learn successfully; includes handicapped students, gifted and talented, and students with multicultural heritages.
 - **Sign Language** - a system of manual communication in which gestures express thoughts.
 - **Structured Instruction** - the method of teaching in which environmental events are carefully manipulated to bring about change in the learner's performance of functional skills.
 - **Visual Impairment** - is a term that describes people who cannot see well even with correction. Students with visual impairment maybe blind, or partially sighted based upon measures of visual acuity.
- Special Education is the individually planned, systematically monitored arrangement of physical settings, special equipment and materials, teaching procedures and other interventions designed to help exceptional/special children achieve the greatest possible self-sufficiency and academic success. (Heward and Orlansky)

Special Education in the Philippines aims to develop the capabilities of children who are physically, mentally, emotionally, socially, or culturally disabled as well children with special talents or giftedness. Special children are attended through modified curricula, special services, and physical facilities for the maximum development of their potential.

Educational programs include the special class plan (in the form of self-contained classroom, resource room plan), special education centers, special schools, and the itinerant teacher plan.

Mainstreaming or integration of children is the main goal of the special education program to allow them to enjoy normal a life as possible.

A mobile training course is also organized on current trends in classroom management and supervision of special education programs as well as the utilization of publications on special education, educating the gifted, the Braille Code, basic sign vocabulary, and regulations and standards for special schools.

How many are PWDs in the Philippines?

Figure 1.
Percent Distribution of Persons with Disability by Type of Disability: 2000

What are the laws relative to the protection and care of the PWD's rights?

- **Magna Carta for the Disabled Persons (RA 7277) – March 24, 1992**
- **Section 4: Definition of Terms**
It defines Disabled Persons as those suffering from restriction, as a result of a mental, physical, or sensory impairment to perform an activity in the manner or within the range considered normal for a human being;
- **ACT NO. 9442,**
An Act Amending Republic Act No. 7277, Otherwise known as the “Magna Carta for Persons with Disability as Amended, and For Other Purposes” Granting Additional Privileges and Incentives and Prohibitions on Verbal, Non-Verbal Ridicule Against Persons with Disability
- **Batas Pambansa Blg. 344** – An Act to Enhance the Mobility of Disabled Persons by Requiring Certain Buildings, Institutions, Establishments, and Public Utilities to install Facilities and Other Devices
The Bureau of Elementary Education
Special Education Division (SPED)

Vision

The State, community, and the family life hold a common vision for the Filipino child with special needs:

- he/she could be adequately provided with basic education
- education should fully realize his/her own potentials for development and productivity as well as being capable of self-expression of his/her rights in the society
- he/she is God-loving and proud of being a Filipino

The fundamental principle of inclusive school is that all children should learn together, wherever possible, regardless of any difficulties or differences they may have (The Salamanca Statement on Principles, Policy and Practice in Special Education).

Philosophy

- The State shall promote the right of every individual to relevant quality education regardless of sex, age, breed, socio-economic status, physical and mental condition, social or ethnic origin, political and other affiliation. The State shall therefore promote and maintain equality of access to education as well as the enjoyment of benefits of education by all its citizens (BP Blg. 232).
- Every child with special needs has a right to an educational program that is suitable to his needs. Special Education shares with regular education basic responsibilities of the educational system to fulfill the right of the child to develop to his full potential

Goals and Objectives

The ultimate goal of special education shall be the integration or mainstreaming of learners with special needs into the regular school system and eventually in the community.

- Special education shall aim to develop the maximum potential of the child with special needs to enable him to become self-reliant and shall be geared towards providing him with the opportunities for a full and happy life.

The specific objectives of special education shall be the development and maximization of learning competencies, as well as the inculcation of values to make the learners with special needs a useful and effective member of society.

- Facts**

As of Academic Year 2004-2005

*156,270	children with special needs are enrolled in schools
- 77,152	are mentally gifted/fast learners (G/FL)
- 79,118	are children with disabilities
	- 40,260 learning disabled (LD)
	- 11,597 hearing impaired (HI)
	- 2,670 visually impaired (VI)
	- 12,456 mentally retarded (MR)
	- 5,112 behavior problem (BP)
	- 760 orthopedically handicapped (OH)
	- 5,172 autistic children (Au)
	- 912 speech defectives (SD)
	- 142 chronically ill (CI)
	- 32 children with cerebral palsy (CP)
*2,149	schools offering SPED programs
	- 4 national special schools
	- 450 private special schools
	- 151 recognized Special Education Centers
	- 1,544 regular schools with SPED programs
	- 4,034 Special Classes

Strategies to Support Mainstreamed Students in the General Education Classes

1. Increase student's sense of belonging.
 - Demonstrate respect for the student by using age-appropriate language, and being a good role model.
 - Involve the student in the typical classroom routine.
 - Work with your educational and students to find ways for the student to participate actively in the classroom activities.
 - Consult with specialists for ideas, and express your concerns.
 - Encourage students to find ways to increase learning opportunities for classmates who are challenged.
 - Promote equality and interactions with other classmates. Remember to use "friend" instead of "peer tutor" and say "go together" rather than "take _with you".
2. Accepting varied learning goals.
3. Making Environmental Accommodation.
4. Team Teaching
5. Cooperative Learning
6. Accommodating personal learning styles.
7. Providing Hands-on instruction

Providing Opportunities for Functional Practice

In addition to hands- on activities, opportunities for functional practice are also important. When practice is relevant, students can easily see the connection between what they are practicing and its use in life. The following are some examples:

Reading Activities

1. Directions (for cooking, building a model, repairing appliances
2. Directional orientation and map reading
3. Menus
4. Labels on foods, medicines and clothings
5. Telephone book
6. Selecting something to order
7. Schedules
8. Signs

Writing Activities

1. Writing a message to a friend
2. Writing to request for something
3. Making a shopping list
4. Ordering something by filling the form
5. Writing down telephone message

Rhythmic and Dance Activities

1. Moving in time with music
2. Imitating movements
3. Creating own dance moves
4. Improvising musical instruments

Encouraging Parental Involvement

Parents play a vital role in determining the student's educational program. Knowing the parent's goals for their child can help everyone work together as a team.

Cooperative Teaching

General and Special education teachers can work together to enhance instruction for students with disabilities through co-planning and co-teaching.

- Co-Planning-general education and special education teachers plan specific lessons and desired results.
- The teachers decide who will take the lead in the lesson, who will ensure that target students' needs are met and who will provide individual or small group instruction.
- Co-teaching- both the general education and special education teachers are both in the classroom during the same lesson and both participative in the instruction.
- Co-assessment-grading is an important consideration when students with disabilities are in general education classrooms. Both teachers assess student's performance and output as they share observations and evaluation.

SAMPLE CONTENT OF IEP

- ▶ STUDENT'S PROFILE
- ▶ SUMMARY OF PRESENT LEVELS OF PERFORMANCE
- ▶ ANNUAL GOALS AND SHORT TERM SERVICES
- ▶ PROPOSED EDUCATIONAL PROGRAM AND RELATED SERVICES
- ▶ GRADUATION STATUS
- ▶ ALTERNATIVE DISCIPLINARY PROCEDURES REQUIRED
- ▶ IEP COMMITTEE MEMBERS
- ▶ AGREEMENT

MAINSTREAMING

- ▶ REFERS TO THE INCLUSION OF SPECIAL STUDENTS IN THE GENERAL EDUCATION PROGRAM

INTEGRATING STUDENTS WITH SPECIAL NEEDS INTO THE REGULAR PHYSICAL EDUCATION PROGRAM**Task Card**

- ▶ Task or Challenge cards are enjoyable way of individualizing game, dance and gymnastic activities
- ▶ The teacher prepares a series of tasks varying from simple to more complex to adapt to the differences and abilities of the students

**▶ Inventive game****▶ Inventive game**

make-up a game with your partner that includes one ball, a bounce and a catch

▶ Dance

Develop a routine that includes a clap, walk, hop, and 3 changes in direction

PART II – ANALYZING TEST ITEMS

1. An Act providing for the rehabilitation, self-development, and self-reliance of disabled persons and their integration into the mainstream of society is known as
 - A. RA 7277
 - B. RA 7394
 - C. RA 8749
 - D. RA 344

The correct answer is option **A (RA7277)**. Option B (RA 7394) is Consumer Act of the Philippines, C (RA 8749) is Clean Air Act, and D (RA 344) is Accessibility Law.

2. Mrs. Pablo handles a regular class with one mainstreamed blind student. What can she do during PE class
 - A. Exempt the student
 - B. Modify instruction
 - C. Modify activity
 - D. Give other classroom work

The correct answer is option **C**. There is no need to modify instruction since there was no mention that the blind student has other difficulty. It is only in the activity that the teacher could modify to suit the need of the special student. Option A is never a good option because PE can help the special student to become fit. Option D will deprive the blind student of the benefit of physical activity.

3. A MAPEH teacher happens to handle an ADHD student. What can the teacher do during the PE period when he starts to bully other classmates
 - A. Reprimand him and take him out of the activity
 - B. Make him in-charge of the distribution and retrieval of sports equipment
 - C. Group him with other bullies
 - D. Make him a leader of a group
4. A partially sighted student would like to join the dance club. What could the dance adviser do to accommodate the special student
 - A. Allow the student to audition together with the other normal students
 - B. Give special consideration to a special student
 - C. Do not allow him to join the club because it will difficult for him to adjust
 - D. Let other dancers tutor him
5. Teacher Joyce is a MAPEH teacher who has five students with special needs in her Art class. One of the students has emotional and behavior disorders and has difficulty staying on task, not disrupting others and raising his hand when he has something to say. Unfortunately, several students seemed to be learning his “bad” behavior instead of him learning the good behavior of the other students. Which of the following measures should teacher Joyce use to solve the problem:
 - A. use peer recognition
 - B. ignore the situation on purpose
 - C. use punishment
 - D. time out
6. An important factor that positively affects students with physical and health handicapping situation in Music and Art class is the extent to which they are busy in purposeful, authentic activities. Which of the following does not describe adapting for instruction:
 - A. Look for opportunities for rewards and punishments

- 166 PNU LET Reviewer

15. Many special students encounter difficulty in social interactions with regular class peers and teachers. Most common sources of the problem are the following except
- The behavior of the special student
 - The attitudes and behavior of the regular students
 - School staff and administration's lack of knowledge about special students
 - Parents of special students who are overly protective
16. The following statements about disabilities and handicaps are correct except
- A student may be disabled without being handicapped.
 - A disability is some sort of impairment.
 - Male students with special needs are more common than female students.
 - Physical disability is directly related to intelligence.
17. Which of the following statement best explains modification for special students?
- When regular students have questions regarding the mainstreamed students, the teacher must answer them promptly and honestly.
 - Before a special student becomes a member of the class, the regular teacher prepares the other students by not only talking about the special student's disability but also about his/her interests, hobbies and talents.
 - Regular classroom teachers must group students with special needs with other students with learning needs.
 - Call special attention to mainstreamed students. There should be a special treatment, special assignment and must be given privately.
18. Identify the correct sequence of activities when a regular classroom teacher wants an individualized instruction
- selection of the learning task
 - apply skills from the previous concepts
 - present the materials for the task
 - master the learning task
 - practice the learning task
- A. 1,2,3,4,5 C. 1,3,5,4,2
B. 1,3,4,5,2 D. 1,2,4,3,5
19. Which of the following is not true about the use of drugs in management of hyperactivity?
- Drug treatment should be considered a permanent solution to a youngster's problem.
 - During the course of drug treatment, the child should periodically be drug free.
 - Drugs should be considered only when there is a demonstration of inordinately inappropriate behavior.
 - Before drug treatment is implemented, behavior modification procedures or remedial techniques should be attempted.
20. When is the right time to prepare the IEP?
- When the resource room is ready
 - When assessment is complete
 - When remediation is completed
 - When the child is enrolled
21. Special students can earn time to use media such as film, film strips, videotapes, and television as
- Rewards for appropriate behavior
 - Direct instruction in interpersonal skill
 - An aid in the presentation
 - An aid to monitor independent practice

22. Mildly retarded students have special needs in academic, classroom behavior, physical needs and social performance. Which of the following are indicators of mild retardation?
- Acting out or withdrawn behavior
 - Sensory impairment
 - Slow rate of learning
 - Excels in one or two areas
23. The following are descriptions of language disorder except
- The inability to communicate using symbols
 - Inability to use appropriate grammatical pattern
 - Difficulty in producing sounds
 - Proper use of speech sounds
24. Which of the following government agencies is in-charge of the special education program in the Philippines?
- Commission on Higher Education
 - Bureau of Elementary Education
 - Bureau of Secondary Education
 - Department of Education
25. The following classification of special students have physical needs except
- Learning disabilities
 - Mental retardation
 - Vision/Hearing Impaired
 - Speech/Language disorder

PART III – ENHANCING TEST TAKING SKILLS

- Which of the following statements is true about special students?
 - Children with special needs can be effectively integrated in the regular PE program.
 - Children with special needs are educated in the least restrictive environment.
 - Students with mental retardation, physical and health disabilities, and autism are admitted in the mainstream.
 - The Bureau of Secondary Education takes care of the SPED programs in the DepEd.
- Children with the following disability constitute the greatest percentage of exceptional children in the public school
 - Learning disability
 - Mental retardation
 - Physical and Health handicapped
 - Visual Impairment
- Students with mild mental retardation has an IQ of
 - 40-50
 - 50-70
 - 70-80
 - 80-90
- Ten percent of all persons with mental disability are born with a chromosomal abnormality which results to
 - Cerebral Palsy
 - Hearing Impairment
 - Down Syndrome
 - Epilepsy
- It is a condition of recurring seizures that is initiated by abnormal electrical charges in the brain.
 - Cerebral Palsy
 - Down Syndrome

- C. Seizure Disorder
 - D. Perceptual-Motor Deficiencies
6. Sensory impairment and neurological disorders include all of the following except
- A. Perceptual-Motor Deficiencies
 - B. Hearing Impairment
 - C. Seizure Disorders
 - D. Visual Impairment
7. The following are contents of the Individualized Education Program (IEP) except
- A. Summary of present level performance
 - B. Annual goals
 - C. IEP committee members Agreement
 - D. Daily goals
8. The following are symptoms of perceptual-motor deficiencies except
- A. Body image
 - B. Balance
 - C. Hand-eye and foot-eye coordination
 - D. Tactile awareness
9. Eating disorders associated with obesity among special students include anorexia nervosa and bulimia. The criteria for obesity depend upon the assessment approach used which is
- A. Physical Fitness test
 - B. Skinfold caliper
 - C. Treadmill test
 - D. Food Intake Analysis
10. This type of impairment denotes any congenital or acquired impairment that has produced a motor disability.
- A. Traumatic brain injury
 - B. Orthopedic impairments
 - C. Postural deviations
 - D. Cardio-respiratory disorders
11. The term physically awkward refers to children who do not suffer from a known neurological or physical disability, yet have difficulty learning and performing basic motor skills. The following are common warning signs except
- A. Late in walking
 - B. Poor catching skills
 - C. Difficulty coping with friends
 - D. Dislike of climbing equipment
12. The following descriptors are inherent in physically awkward children except
- A. Poor school achievement
 - B. Reading difficulties
 - C. Low self-esteem and self-concept
 - D. Balance and spatial orientation
13. Parents, teachers, and school officials have always been concerned about children's posture because it has something to do with a child's personality. Which of the following is the primary cause postural problems
- A. Chronic television watching
 - B. Inadequate daily exercise
 - C. Slanting desks
 - D. Poor lighting
14. The organizational structure of station work for special students in physical education is more effective with the use of
- A. Task cards
 - B. Peer tutor
 - C. Circuit training
 - D. Obstacle course
15. Stations are particularly useful when attempting to individualized the instruction program for the different physical activities. Which of the following activities is appropriate for three children with moderate limitations and cannot participate in rigorous activities?
- A. Rope climbing
 - B. Small equipment use
 - C. Mat activities
 - D. Vaulting box

16. One major challenge in the field of special education program is inclusion. Inclusion is originally called
- A. Streamlining
 - B. Mainstreaming
 - C. Integration
 - D. Individualizing
17. Students with rheumatic fever can be dealt with which of the following guidelines?
- A. The amount and type of physical activity must be prescribed by a physician.
 - B. Teachers should not allow students to participate in physical activities.
 - C. Parents should report to the teachers the early signs of fatigue.
 - D. Take the child's pulse before any physical activity is started.
18. Two most common respiratory impairments are asthma and cystic fibrosis. Most asthmatic children can participate in the regular activities except when any of these situations is present except
- A. Heavy coughing
 - B. Heavy wheezing
 - C. Tightening of chest
 - D. High Fever
19. The State shall therefore promote and maintain equality of access to education as well as the enjoyment of benefits of education by all its citizens. Which is the legal basis for this?
- A. RA 9165
 - B. BP 232
 - C. BP 344
 - D. RA 7277
20. Studies of the most accommodating teaching and participation effects for various children with special needs who require great amounts of assistance emphasize the use of
- A. Individualized instruction
 - B. Peer tutor
 - C. Collaborative work
 - D. Group approach
21. In terms of the public school system, students who possess this level of mental disability are classified as educable.
- A. Mild or moderate
 - B. Moderate or severe
 - C. Mild or profound
 - D. Profound or moderate
22. The following guidelines will help teachers integrate students with visual impairments into the regular physical education program except
- A. Use bright colored objects to encourage children to use their residual vision
 - B. Use tactile and auditory boundary
 - C. Use peers to guide children with visual impairment
 - D. Use children with visual impairments as posts in the given activity
23. Which of the following can be done to help children with special needs?
- A. Early identification of the disability
 - B. Consultation with parents
 - C. Consultation with medical practitioners
 - D. Early intervention for the disability
24. Which of the following types of postural defects belong to the first type of functional deviation?
- A. Kyphosis (Round upper back)
 - B. Lordosis (hollow back)
 - C. C-shaped Scoliosis (lateral curvature)
 - D. S-shaped Scoliosis (Lateral curvature)
25. The intramural program provides an excellent opportunity to integrate children with special needs. This can be accomplished by
- A. Modifying games
 - B. Modifying instruction
 - C. Modifying equipment
 - D. Modifying facilities

Gymnastics

Prepared by:
Prof. Rosanna A. Diana

Competencies:

1. Define movement skills and activities
2. Apply Rhythmic and Artistic Gymnastics Skills
3. Analyze movement skills for educational gymnastics and sports activities.

PART I - CONTENT UPDATE

In The Beginning

There is no human knowledge available about the earliest times of acrobatic efforts. There is no doubt, however, that people performed individual tumbling movements, group acrobatics, and swing from branches early in their history.

The Egyptians and Chinese

Stone cuttings show that people were building human pyramids (along with stone pyramids!) and balancing stunts in Egypt as early as 2100 BC. Circus- like acrobatics were performed in ancient Egypt. In the 2nd century BC, men and women of Minoan Crete developed the art of bull leaping. In bull leaping the performer would run toward a charging bull, grab its horn and upon being tossed into the air, execute various midair stunts before landing on the bull's back and dismount with a flip. The Chinese have probably performed such stunts even before this time.

The Greeks

In Ancient Greece, three distinct programs of gymnastic exercise were developed:

1. For maintenance of good physical condition
2. For military training
3. As part of the conditioning regime for athletes

The early Greek teachers of physical fitness (paidotribes) were the first to design a system of physical activity for both athletes and general citizenry. Such programs, which included gymnastics, were considered central to the formal education of children. The Greek philosophy portrayed the human body as a temple housing

the mind and the soul, and the practice of gymnastics contributed to the health and functionality of the temple.

They coined the word “gymnastics” from the word “gymnos” meaning “naked art.” They built elaborate complexes known as “gymnasia” for their physical education training. The philosophers of Greece, Plato, Aristotle, and Socrates would go into the gym where they would exercise their bodies and debate philosophy to exercise their minds. The attitude of those early gymnasts was a “sound mind in a sound body.” With the gathering of young and old alike, the gymnasia were more like a town hall than just a gym.

The famous Greek physician, Galen, who wrote a treatise called “Caracalla,” developed a form a medical gymnastics of which we would call physical therapy today. His work emphasized keeping fit exercises of gymnastics for the masses as a means for better health. In time, structured gymnastic and calisthenics exercises were abandoned in favor of game sports.

In 776 BC, the Greeks held the first Olympic Games, which was a festival dedicated to their God Zeus. In this game, there was only a foot race of 200 yards. The games continued for about 1,100 years with boxing, wrestling, throwing, jumping, and weightlifting added. The Olympic Games were finally abolished by the Roman Emperor Theodosius in 392 AD.

The Persians

By 500 BC the Persians had developed the side horse (pommel horse) as a training devise for their cavalry to learn mounts, dismounts, and swinging movements for combat on speeding horse during battle. Even up to just 50 years ago, the side horse had a raised neck and a croup (end) like a real horse.

The Romans

The Romans were a battle- tough people who conquered the known world. After their conquest of Greece, they adopted gymnastics as their own and developed it into a more formal sport. Gymnastic system designed to give strength for military combat were used extensively by the Romans. Their practical nature turned sport into warfare. Like the Persians, the Roman Circus practiced horsemanship and chariot racing in a circle, hence the term circus. Originally designed as a sporting event where Roman soldiers could match their skills and prowess against one another in an Olympian fashion, it quickly evolved into pure carnage. The bloodier the spectacle the more popular it became. People killing people, animals killing animals, animals killing people. It reached its gruesome height under the Emperor Nero. The gymnasiums were used to train their legions for warfare, but with the decline of Rome, interest in gymnastics also dwindled and gymnastics would have been lost completely if it were not for the Medieval Gypsies.

Medieval Gypsies

Gypsies are believed to have arrived in Europe from northern India in the 1400s. They were called Gypsies because Europeans thought they came from Egypt. This ethnic minority is made up of distinct groups called “tribes” or “nations”. The Sinti and Roma spoke dialects of a common language called Romani, based in Sanskrit, the classical language of India. Many Sinti and Roma traditionally worked as craftsmen, such as blacksmiths, cobblers, tinkers, horse dealers, and toolmakers. Others were performers, such as musicians, circus, animal trainers, and dancers.

The sad tale of Gypsies being persecuted continues to this day, with the happy exception of Gypsy dances and music celebrated in 19th century romanticism, for example, as expressed by (Hungarian) Liszt and as observed particularly in Russia where there was a famous Gypsy cabaret in Moscow which had trained bears, acrobats, dancers, and jugglers performed in the Gypsy shows.

Modern Gymnastics

By Lee Bjella

Germany, beginning in 1774, began putting its educational concepts into practice.

Johann Basedow (1723 – 1790) was the first to conduct gymnastics as part of education. He was the first modern writer and teacher of organized gymnastics for whom records survive.

Johann Guts Muth (1759 – 1839) the Great Grandfather of Gymnastics wrote many influential books including carefully chosen gymnastics exercises for girls in 1818. He wrote *Gymnastics for Youth*, the first book on modern gymnastics in 1793. He describes the use of sloping beams, climbing poles, ladders and ropes along with the balancing beam and the swinging beam.

Franz Nachteggall (1777-1847), formed a gymnastics club, opened a private gymnasium and through his success encouraged the government to incorporate training into its school curriculum. His gymnastics program in Denmark emphasized mass calisthenics, mass vaulting and drills using dumbbells and balls.

Gerhard Vieth (1759 – 1839) published a book of exercises. He also described the balance beam, jumping ropes, climbing ropes and poles, the horse, the table and the buck. He wrote of vaulting over horizontal poles at different heights.

Per Henrik Ling (1776 – 1839) In Scandinavia, he was one of the great gymnastics leaders and called the “Father of Swedish gymnastics.” Hundreds of students would participate in mass floor exercise drills.

Johann Pestalow (1746 – 1827) was noted as the founder of free exercise and calisthenics.

Adolph Spiess (1810 – 1858) “Father of School Gymnastics” taught gymnastics to his classes in Switzerland and added marching and free exercises to music.

Friedrich Ludwig Jahn (1778 – 1852) “The Father of Gymnastics.”

The American Gymnastics is largely influenced by Europe as evidenced by the early Turnverein movement in their colleges. **Dr. Dudley Sargent** was the first American contributor to gymnastics because he was instrumental in including gymnastics in the school curriculum.

Gymnastics in the Philippines was started by two exponent of Physical Education – **Director Candido Bartolome** of the University of the Philippines and **Mrs. Francisca Aquino** of the Bureau of Public Schools.

“**Gymnastics**” is a self-motivating activity, where one can manipulate the different parts of the body into varied positions or movements (Clarita P. Diñoso, “Gymnastics Book”, 1990).

At present, Gymnastics is recognized as a systematic form of physical exercises designed for:

Educational Gymnastics – a program that challenges students to master tactics involving strength, balance, flexibility, agility, and rhythm in a classroom standard of learning the fundamentals with the maximum safety measures.

Therapeutic or Remedial Gymnastics – a series of selected exercises that help to relieve physical discomfort or restore function to disabled people.

Competitive Gymnastics – consist of prescribed sets of events for men and women, each of which is scored separately in order to determine a winner.

PHASES OF THE EDUCATIONAL GYMNASTICS PROGRAM

1. Conditioning Program

The exercises are selected for the purpose of preparing the body for more complicated movements and skills. Exercises for the warm-up can also be selected in his phase. This phase can also be considered as “Calisthenics” since routines can be made out of the exercises in the conditioning program.

- **Cool Down Exercises** – serve to gradually taper off the body from the stress of exercises. It is as important as warming up because it keeps the blood circulating around the body to prevent the individual from experiencing some form of dizziness.

2. Stunts

These are activities in the form of play which test one’s strength, flexibility, balance, agility, endurance, and coordination. This phase is specially suited to the lower grades.

Some stunts can be considered as conditioning exercise and still some are preparatory stunts to tumbling skills.

• Types of Stunts

- **Individual Stunts** –these are stunts performed by only one person. Examples: Rocking Chair, Coffee Grinder, Egg Roll, Human Ball, Dog Walk, Lamé Dog Walk, Frog Kick, Frog Jump, Inch Worm, Crab Walk
- **Dual Stunts** – are stunts performed by two. Examples: Wring the Disk Cloth, Chinese Get–Up, See–Saw, Jump Over, Three Partners – One Jump Over
- **Group Stunts** – are stunts performed by 3 or more persons. Examples: Walking Chair, Merry–Go–Round, Skin the Snake
- **Combative Stunts** –are stunts where two or more fight each other showing strength, balance, agility, and endurance. Examples: Rooster Fight, Indian Wrestle, Tug of War

3. Tumbling (Acrobatic skills)

This is the most important phase of the gymnastics program, because the ability of the performer is tested as he rolls to and fro, twists, turns, and springs about on the mat, floor, and in the air.

4. Rhythmic Gymnastics

Routines or Exercises accompanied with music are called “Rhythmic Gymnastics”. They are so- called because they are performed in a rhythmical manner and the movements are flowing. This phase includes the free hand exercise and all exercise with use of light apparatuses such as wands, rings, hoops, ribbons, ropes, etc. Gymnastics skills, dance skills, locomotor skills, stunts, and tumbling skills are combined to form a routine on the floor. This is where the performer can create and develop her own routine according to her abilities.

5. Apparatus Work (Heavy)

This includes exercises done on the balance beam, vaulting horse, parallel bar, uneven bars, rings, and the trampoline.

6. Pyramid Building

This phase of the program makes a picture (mural) out of body static positions. The positions should be properly arranged and selected, so that they form the shape of a pyramid.

COMPETITIVE GYMNASTICS

1. **Artistic Gymnastics (AG)** – gymnastics discipline where the gymnasts perform on top of the heavy apparatus. A competitive event separates men and women.

Women's Artistic Gymnastics (WAG) – Gymnastics discipline played in four (4) events:

- **Horse Vault** – 160 cm. long 35 cm. wide with an adjustable height of 120 cm. for women.
- **Asymmetrical Bars** – parallel bars with one bar 2.3 m. high and the other bar 1.5 m. with an adjustable width of 86 cm. maximum.
- **Balance Beam** – 500 cm. long, 13 cm. wide, set at a height of 120 cm. The surface is slightly padded to make it slightly springy for protection.
- **Floor** – a carpeted area 12m X 12m square built on a springy base and marked by a white line and surrounded by a wide, sloping, safety border.

Men's Artistic Gymnastics (MAG) – Gymnastics discipline played in six (6) events:

- **Floor** – built on a springy base, carpeted area 12m X 12m square marked by a white line and surrounded by a wide sloping safety border.
- **Pommel Horse** – stands 120 cm. high, 160 cm. long and 35 cm. wide.
- **Ring** – 18 cm. in diameter and hand 275 cm. above the floor.
- **Vault** – 160 cm. long, 35 cm. wide and 135 cm in height.
- **Parallel Bars** – 1.5 m. high, 320 m. long, 35 cm. wide in distance.
- **Horizontal Bar** – the bar is 240 cm. wide, set at 275 cm. from the floor.

2. **Rhythmic Sportive Gymnastics (RSG)** – an aesthetic discipline performed to music while using small hand apparatus that seems to be an extension of the body. A competitive event for women either individual or group in a bi – annual rotation of four out of five apparatuses.

- **Rope** – no handle, but must be knotted at the end. The length depends on the height of the gymnast. A very dynamic apparatus requiring agility and good body coordination. The fundamental requirements are jumps/leaps, skips, and hops.
- **Hoop** – made of plastic material between 80 cm. and 80 cm. in diameter. The apparatus offers greatest variety of movements and technical skills. The fundamental groups of body movements for hoop are jumps/leaps, pivot, balance, and flexibility.
- **Ball** – should be 18 – 20 cm. in diameter and weight 400g. This apparatus is by tradition an elegant and “lyrical” rather than dynamic apparatus. The fundamental movements are flexibility elements.

- **Clubs** – made of plastics materials, a great hand game that requires rhythmic work, psychomotor coordination, and clockwork precision.
 - **Ribbon** – is 7m long with 1m folded and sewn on one end. The actual length of 6m is hooked on the swivel, attached on the wand. This event requires a large and free- flowing movement that aims to create designs in space. The fundamental body movement is pivots.
3. **Aerobics Gymnastics** – gymnastics discipline integrates the difficult elements of gymnastics with aerobic dance steps and movements in order to create a dynamic choreography for the sports either individual, mixed pair, three or group.
 4. **Acrobatics Gymnastics** – a gymnastics discipline where boys and girls take part balancing with partners with selected acrobatics skills and balances and dance movements.

PHYSICAL FITNESS is the capacity of the individual to accomplish his/her regular daily task/activities without undue fatigue and still has an ample amount of reserved energy to enjoy leisure and meet emergencies.

Physical Fitness Components

Health Related Components

- ***Strength** – is the capacity to sustain the application of force without yielding or breaking; the ability of the muscles to exert effort against a resistance.
- ***Endurance / Stamina** – is the ability to sustain long-continued contractions where a number of muscle groups are used; the capacity to bear or last long in a certain task without undue fatigue.

- ***Flexibility / Suppleness** – is a quality of plasticity which gives the ability to do a wide range of movement.

It involves four basic movements, namely:

- a. Flexion – bending a body segment;
- b. Extension – straightening a body segment;
- c. Abduction – moving a limb away from the body; and
- d. Adduction – moving a limb toward the body.

Body flexibility is achieved through stretching specific segments of the body. To achieve good body flexibility, exercises should be performed daily. For very tight muscle–joint area, it is highly recommended that flexibility exercises be done at least twice a day.

Types of Stretching

- a. **Passive Assisted Stretching** – involves relaxing a specific body part and just allowing the partner to move the limb of the stretcher to gain a new range of movement. Done without caution, this type of stretching may cause muscle injury because the person assisting the stretcher cannot adequately determine the sensation of the latter. Thus, the risk of injury associated with overstretching a specific muscle group is high for this type of stretching.
- b. **Static Stretching** – involves slowly stretching a segment of the body to the farthest point and holding that position for a certain period of time. Usually performed without a partner, each stretch is easy and pain – free. Once the stretcher has achieved its full range of movement and begins to feel a mild discomfort (muscle tension) in the body part being stretched, the position is held statically. The risk of injury associated with this type of stretching is very minimal.

- c. **Ballistics Stretching** – involves a sudden, bouncing or jerking rhythmic movement of a specific part of the body. In ballistic stretching, the stretcher does not know how far the soft tissue structures can extend during the exercise, thus, the probability of tearing a muscle becomes apparent. In many cases, this type of stretching causes muscle soreness.
 - d. **Proprioceptive Neuromuscular Facilitation (PNF)** – involves the hold – relax (HR) approach to stretching. During the hold – relax, the partner attempts to move the limb at its lengthened range of motion and isometrically resist the partner's attempt to move the limb into a deeper stretch. Then, the stretcher relaxes the limb and the partner slowly moves the segment into a new range. PNF is generally used if range of motion is extremely limited and if active movement causes pain.
- ***Body composition** – refers to the proportion between fat weight and total body weight. It is determined by the amount of fat and lean tissue in the body.

Skill / Performance Related Components

- **Power** – refers to the ability of the muscles to release maximum force in the shortest period of time.
- **Agility** – is the ability of the individual to change direction or position in space with quickness and lightness of movement.
- **Speed** – is the ability to make successive movements of the same kind in the shortest period of time.

- **Coordination** – is the ability to use your senses together with your body parts or to use two or more body parts together.
- **Balance** – is the ability to control organic equipment neuro-muscularly; a state of equilibrium.

Body Awareness refers to the consciousness to the body as a whole. It refers to the awareness to grasp the different kinds of movement that each body part can do and the awareness to grasp of its relation to space, time, force, and rhythm. It is the total awareness of what the body can do and where the body is, which leads to a greater body control and successful skill learning.

The Body has four (4) major divisions. They are the:

- Head
- Trunk
 - Chest region
 - Waist
 - Abdominal region
 - Hip region
 - Buttocks
 - Back – upper back and the lower back
- Upper Extremities or Arms
 - Hands – fingers, palm
 - Wrist
 - Arms – forearms, elbow
 - Shoulder girdle
- Lower Extremities or Legs
 - Feet – toes, heels
 - Ankles
 - Legs – thigh, hamstrings, lower legs, knees

Planes – the imaginary, two– dimensional surface in which movements are performed.

Three (3) Body Planes corresponding to the three (3) dimension of space:

- **Frontal / Lateral** – divides the body into half (front and back)
- **Sagittal** – divides the body into half (right and left)
- **Transversal / Horizontal** – divides the body into half at a given point parallel to the ground (upper and lower)

Spatial Directions – the way where the movements are to take place

- Sideward – right and left
- Forward and Backward
- Diagonally Forward / Backward
- Upward and Downward
- Clockwise and Counterclockwise

Axes – an imaginary line used to rotate, passing through the center of gravity.

- **Horizontal/ Transverse** – the axis from one side of the waist to the other (rolling)
- **Vertical/ Longitudinal** – the axis from the head to the toe (pirouette)
- **Medial** – the axis from the front to back (cartwheel)

Level – are positions with reference to height.

- **Low Level** – usually designated as anything below your own hip level.
- **Middle Level** – is usually any movement or shape that is between your own hip level and the top of your head when standing normally.
- **High Level** – is anything above your own normal head height and may include standing on the half toe, movement into the air and upward movement, or by being lifted.

MOVEMENTS

Fundamental Movement Skills:

➤ **Locomotor Movement Skills** – used to move the body from one location to another.

- Walking is a series of steps in all directions.
- Running is a fast walk with longer strides and there is a push-off by the foot to suspend the body momentarily in air.
- Hopping is a spring on one foot and land on the same foot.
- Skipping is a step and a hop with the same foot in one count.
- Leaping is a spring on one foot and land on the other foot.
- Sliding a full contact of the foot on the floor by gliding in any direction.
- Galloping a combined step and a cut (shift weight or displace the other foot)
- Jumping is to spring on one or both feet and landing on both feet.

➤ **Non-locomotor Movement Skills** – in which the individual does not have to change location in order to practice an activity

- Bend or Flexion to move the body or part of the body around a wide axis.
- Stretch, Extend, Straighten to lengthen a part of the body.
- Twist to move a body around a long axis.
- Lift, Raise to elevate a part of the body or the whole body to a desired level
- Circle to move a body around a point.
- Rotate/Turn to change direction to move around an axis.
- Swing to move continuously from one point to the other.

- **Manipulative Movement Skills** – used to handle or manipulate play objects, such as ball, wands, hoops, bats etc. They include movements that increase hand–eye and hand – foot coordination, tracking skills, and dexterity and propulsion skills, such as throwing, kicking and batting.
- **Specialized Movement Skills** – related to specific sports, games and apparatus. Skills are structured (specific rules, guidelines and techniques)

TERMS IN GYMNASTICS

- ARCH** – is a position where the body is curved like an arc of a circle, with the hip forward and the head and trunk bent backward.
- BASE** – a partner who supports the other performer above him.
- TUCK** – is position where the head and the knees are in contact and the trunk is curved.
- MOUNT** – are stunts performed by a performer to go up on an apparatus.
- DISMOUNT** – is a stunt used by a performer to get off on an apparatus.
- SPOTTER** – is a person who helps a performer to go about a skill for the first time.
- SPOTTING** – is the act of helping a person to go about a skill for the first time.
- EXERCISE or ROUTINE** – planned series of dance skills, locomotor skills, gymnastics skills and tumbling skills performed with or without music.
- FLIP** – a hand spring

HELD or STATIC POSITION – these are positions held for 2 or more seconds.

- PIKE** – the upper body is bent forward at the hips to an angle equal to or less than 90 degrees while the legs remain straight.
- PRESS** – is the application of steady pressure to a particular muscle or group of muscles in order to attain a desired stretch.
- PRONE** – lying face down with the body straight.
- SCALE** – is a support on one leg with the other leg raised at the back and the body arch.
- STRADDLE** – the legs are extended sideways.
- SUPINE** – lying flat on the back, with the body straight.
- SPLIT** – is a position where the legs are extended forward and backward in a straight position.
- TOP** – the partner who is supported by the base.

TUMBLING SKILLS

➤ Forward Roll (movement analysis)

- Squat position knees together; place hands in front of the knees flat on the floor, fingers pointing front.
- Tuck the head so the chin touches the chest.
- Raise buttocks up to pike position.
- Bend arms until the shoulders reach the mat.
- Roll on back in tuck position.
- Come up to squat position, arms forward.

Example of Variations:

Straddle to Straddle

Pike to Pike

➤ **Backward Roll (movement analysis)**

- With the back facing the mat, squat position; arms in front of the knees, hands flat on the floor.
- For momentum, place weight of the body before the roll.
- Sit to tuck position to continue rolling on the back; elbow close to the head; fingers pointing back.
- Continue rolling until the hands touch the mat, (overhead reach position)
- Immediately push with the hands to clear the head.
- End in squat position, arms forward.

Example of Variations:

Straddle to Straddle

Pike to Pike

➤ **Cartwheel (movement analysis)**

- Standing on the left foot, right pointed forward; arms overhead close to the ears.
- Step the right foot forward at the same time kicks the left leg sideward and place the right hand on the mat, weight of the body in it.
- Continue the body and leg rotation transferring the body weight on the left hand; legs in wide stride in air.
- Land on the left leg sideward left, and stand.

➤ **Handstand (movement analysis)**

Hands and Feet Positions

- The hands are placed in front of the right foot; the elbows locked. The shape is a triangle.
- The palms are flat on the floor, fingers are spread and pointing forward.
- The weight of the body is on the heels of the hands, the fingers help in the balance.

Steps

- Starting position: Facing the mat in standing position weight on the left foot, right foot pointed in front; arms upward close to the ears.
- Lower the arms sideward down to arms close to the hips and on the floor at the same time, step right foot; the left leg kicks upward in rear to vertical position. (Spotter holds the left leg in that position.)
- Have the right leg join the left leg in handstand position. The body should be well contracted, the head is held up.

Spotting

- The spotter stands in front of the performer as close as possible to be able to catch the left leg in the upward kick.

➤ **Front Walkover (movement analysis)**

- Start on standing position on one leg, the other leg pointing forward, arms overhead.
- Lift the pointed leg forward about 6 – 12 inches off the floor, the arms stretched overhead
- Step the lifted leg forward to a lunge position, lean trunk slightly forward hands to reach the floor.

- Push through the supporting leg to come up to a handstand position, with leg on a wide split position
- Push body forward, keeping the other leg high and straight as the first comes down.
- Bring the second leg down to finish on standing position as in starting position.

➤ Back Walkover

- Start on standing position on one leg, the other leg pointing forward, arms overhead.
- Lift the pointed leg as the back arched, the arms stretched overhead to reach the floor.
- Push through the supporting leg to come up to a handstand position, with leg on a wide split position.
- Keeping the other leg high and straight as the first comes down.
- Bring the second leg down to finish on standing position as in starting position.

PART II – ANALYZING TEST ITEMS

1. A gymnastics discipline where every gymnast performs to show his or her prowess on top of the apparatus
A. Rhythmic Gymnastics C. Artistic Gymnastics
B. Sports Acrobatics D. Sports Aerobics
2. When the coach extends the degree of stretch, care should be taken to prevent tissue tearing, what type of stretching is this?
A. Active Stretching C. Passive Stretching
B. Inactive Stretching D. Proactive Stretching
3. In doing this skill make sure hands are shoulder- width apart, knees are bent and head is tucked forward towards the knees. Hands are placed on mat facing in direction of travel. Rotate body forward along mat transferring weight onto shoulders then the back, with the body in a tight ball shape. Recovery can be in a position of own choice.
A. Backward Rolls C. Toward Rolls
B. Onward Rolls D. Forward Rolls
4. This is the quick change of direction of the body, and may be improved by increasing the number of rolls or pre-acrobatic movements done under the thrown apparatus.
A. Flexibility C. Speed
B. Agility D. Power
5. This program is generally introduced in a form of a play for fun and enjoyment, as the child develops the fundamentals of tumbling skills.
A. Tumbling C. Pyramid Building
B. Stunts D. Apparatus work

6. This locomotor movement, which is a combination of a step and a hop, generally shows speed of action and jolly expression of movement.
 - A. Leap
 - B. Skip
 - C. Gallop
 - D. Hop
7. It refers to how fast successive contractions or movements can be executed. It can be improved by repeated fast movements. Example is increasing the number of skips in a set time frame.
 - A. Muscular Endurance
 - B. Muscular Strength
 - C. Muscular Speed
 - D. Muscular Power
8. A Gymnastics position in which one leg is extended forward, the other leg is extended backward at right angle to the trunk.
 - A. Scale
 - B. Deep Lunge
 - C. Swan
 - D. Split
9. These gymnastics equipment like the pommel horse, horizontal bar, horse vault and parallel bars are being used in this gymnastics event.
 - A. Men's Artistic
 - B. Sports Aerobics
 - C. Rhythmic Sportive
 - D. Women's Artistic
10. If a hop is a spring on one foot and land on the same foot, then what is a jump?
 - A. A spring on one foot and land on the other foot
 - B. A spring on one foot or both feet and landing on both feet
 - C. A spring on left foot and landing on the right foot
 - D. A spring on both feet and landing on one foot
11. A gymnastics discipline integrates the difficult elements of gymnastics with aerobic dance steps and movements in order to create a dynamic choreography for the sports either individual, mixed pair, three, or group.
 - A. Artistic Gymnastics
 - B. Educational Gymnastics
 - C. Rhythmic Sportive Gymnastics
 - D. Sports Aerobics
12. It is when a muscle performs repeated contractions. The duration of this muscle work should be gradually extended. Example is the length of time for continuous straddle jumps 10 secs. . . 15 secs. . . 20 secs. . .
 - A. Muscular Endurance
 - B. Muscular Strength
 - C. Muscular Speed
 - D. Muscular Speed
13. It is a gymnastics position or shape when the body and legs are extended upward, while the head, shoulder and the bent elbow support the extended body.
 - A. Headstand
 - B. Handstand
 - C. Shoulder stand
 - D. Stride stand
14. Gymnastics stunts where one works with someone about his size, height, and weight that aims to develop coordination, balance, and cooperation.
 - A. Combative Stunts
 - B. Individual Stunts
 - C. Dual Stunts
 - D. Group Stunts
15. This is the fundamental aspect of skill development. Example is the continuous skipping.
 - A. Speed
 - B. Coordination
 - C. Flexibility
 - D. Agility

16. Women's Artistic Gymnastics (WAG) is a gymnastics discipline where the gymnast shows a lot of styles, strength, power, and endurance in her routine. One of the apparatuses below is used in one of the four (4) WAG events.
- A. Ribbon
 - B. Trampoline
 - C. Asymmetric Bars
 - D. Parallel Bars
17. This phase of the program makes a picture (mural) out of body static positions. The positions should be properly arranged and selected, so that they form the shape of a pyramid.
- A. Stunts
 - B. Pyramid Building
 - C. Rhythmic Gymnastics
 - D. Conditioning Program
18. A program that challenges students to master tactics involving strength, balance, flexibility, agility, and rhythm in a classroom standard of learning the fundamentals with the maximum safety measures.
- A. Educational Gymnastics
 - B. Competitive Gymnastics
 - C. Therapeutic or Remedial Gymnastics
 - D. Creative Gymnastics
19. This is the most important phase of the gymnastics program, because this is where the ability of the performer is tested as he rolls to and fro, twists, turns and springs about on the mat, floor and in the air.
- A. Tumbling
 - B. Stunts
 - C. Rhythmic Gymnastics
 - D. Pyramid Building
20. A position where the body is curved like an arc of a circle, with the hip forward and the head and trunk bent backward.
- A. Arch
 - B. Tuck
 - C. Split
 - D. Scale
21. The preparatory position in backward roll where the feet are held together with knees straight and trunk bent forward towards the legs.
- A. Squat
 - B. Pike
 - C. Tuck
 - D. Straddle
22. The exercises are selected for the purpose of preparing the body for more complicated movements and skills. Exercises for the warm-up can also be selected in this phase can also be considered as "Calisthenics."
- A. Cool – Down Exercises
 - B. Marching Exercises
 - C. Rhythmic Exercises
 - D. Conditioning Program
23. An artistic gymnastic terminology for tumbling type movements. Examples are cartwheel, handspring, etc.
- A. Stretchy
 - B. Elastic
 - C. Acrobatic
 - D. Supple
24. It is an aesthetic combination of the body movements to music with portable apparatus.
- A. Artistic Gymnastics
 - B. Educational Gymnastics
 - C. Rhythmic Sportive Gymnastics
 - D. Sports Aerobics
25. A gymnastics position in which the legs are separated sideways.
- A. Scale
 - B. Straddle
 - C. Split
 - D. Supine

PART III – ENHANCING TEST TAKING SKILLS

- It refers to the harmonious relation between body and mind where parts and segments of the body move in different ways and directions in a gymnastics routine.
 - Cooperation
 - Coordination
 - Concentration
 - Collaboration
- A regulated external force acting to produce a greater range of flexibility in a relatively inactive muscle.
 - Active Stretching
 - Inactive Stretching
 - Passive Stretching
 - Proactive Stretching
- It means bending or reducing length. It decreases the angle of the joint.
 - Extension
 - Contraction
 - Flexion
 - Reduction
- Being the first to conduct gymnastics as part of education. He was the first modern writer and teacher of organized gymnastics for whom records survive.
 - Per Henrik Ling
 - Franz Nachtegall
 - Johann Basedow
 - Gerhard Vieth
- It is a self-motivating activity, where one can manipulate the different parts of the body into varied positions or movements.
 - Physical Education
 - Physical Fitness
 - Gymnastics
 - Movements
- A person who helps a performer to go about a skill for the first time.
 - Helper
 - Spotter
 - Assistant
 - Spotting
- This locomotor movement, which is a combination of a step and a cut that shows shifting of weight or displacement of the other foot.
 - Leap
 - Skip
 - Gallop
 - Hop
- The Great Grandfather of Gymnastics wrote many influential books including carefully chosen gymnastics exercises for girls in 1818. He wrote *Gymnastics for Youth*, the first book on modern gymnastics in 1793. He describes the use of sloping beams, climbing poles, ladders and ropes along with the balancing beam and the swinging beam.
 - Johann Guts Muth
 - Johann Pestalow
 - Friedrich Ludwig Jahn
 - Adolph Spiess
- The muscles move a limb away from the vertical mid-line of the body.
 - Abduction
 - Extension
 - Adduction
 - Rotation
- Which of these body parts keeps one in state of equilibrium during a one leg balance?
 - Legs
 - Arms
 - Trunk
 - Head
- He formed a gymnastics club, opened a private gymnasium and through his success encouraged the government to incorporate training into its school curriculum. His gymnastics program in Denmark emphasized mass calisthenics, mass vaulting, and drills using dumbbells and balls.
 - Johann Pestalow
 - Adolph Spiess
 - Gerhard Vieth
 - Franz Nachtegall
- A series of selected exercises that help relieve physical discomfort or restore function to disabled people.
 - Creative Gymnastics
 - Competitive Gymnastics
 - Therapeutic or Remedial Gymnastics
 - Educational Gymnastics

13. Type of “stretching,” when the gymnast uses her own strength to manipulate the stretch movements produced by muscle contraction.
- A. Active Stretching
 - B. Inactive Stretching
 - C. Passive Stretching
 - D. Proactive Stretching
14. He was one of the great gymnastics leaders and called the “Father of Swedish gymnastics.”
- A. Friedrich Ludwig Jahn
 - B. Johann Pestalow
 - C. Per Henrik Ling
 - D. Adolph Spiess
15. It consists of prescribed sets of events for men and women, each of which is scored separately in order to determine a winner.
- A. Therapeutic or Remedial Gymnastics
 - B. Competitive Gymnastics
 - C. Creative Gymnastics
 - D. Educational Gymnastics
16. The “Father of School Gymnastics” who taught gymnastics to his classes in Switzerland and added marching and free exercises to music.
- A. Adolph Spiess
 - B. Franz Nachteggall
 - C. Johann Basedow
 - D. Gerhard Vieth
17. Women’s Artistic Gymnastics (WAG) is a Gymnastics discipline played in four (4) events, except one of the following.
- A. Horse Vault
 - B. Asymmetrical Bars
 - C. Balance Beam
 - D. Horizontal Bar
18. He was the first American contributor to gymnastics because he was instrumental in including gymnastics in the school curriculum.
- A. Johann Pestalow
 - B. Dr. Dudley Sargent
 - C. Franz Nachteggall
 - D. Gerhard Vieth
19. Men’s Artistic Gymnastics (MAG) is a Gymnastics discipline played in six (6) events except one of the following.
- A. Pommel Horse
 - B. Asymmetrical Bars
 - C. Parallel Bars
 - D. Ring
20. A planned series of dance skills, locomotor skills, gymnastics skills, and tumbling skills performed with or without music.
- A. Movements
 - B. Aerobics
 - C. Exercises or Routine
 - D. Rhythmic Activities
21. “The Father of Gymnastics.”
- A. Friedrich Ludwig Jahn
 - B. Johann Pestalow
 - C. Franz Nachteggall
 - D. Adolph Spiess
22. It is a quality of plasticity which gives the ability to do a wide range of movement.
- A. Strength
 - B. Balance
 - C. Flexibility / Suppleness
 - D. Agility
23. This is a mild activity used as the body movement slow down until the pulse and breathing rates return to normal.
- A. Cool Down
 - B. Relaxation
 - C. Warm – up
 - D. Aerobics
24. An imaginary straight line around which the hand apparatus or body rotates.
- A. Axis
 - B. Bloc
 - C. Union
 - D. Coalition
25. Ability to keep the center of gravity over the base of support and to maintain equilibrium.
- A. Balance
 - B. Stability
 - C. Solidity
 - D. Poise

Anatomical, Mechanical and Physiological Bases of Movements

Prepared by:
Prof. Teresita T. Evangelista

Competencies:

1. Analyze body parts in relation to movements
2. Identify the components of Physical Education
3. Demonstrate lifetime wellness program and activities

PART I - CONTENT UPDATE

Definition of Terms

- **Anatomy** – is the branch of science that deals with the structure of the body parts, their forms and how they are organized
- **Physiology**- the science that deals with the functions of the body parts - what they do and how they do it.
- **Kinesiology** – is that science that deals with the study of human motion
- **Mechanics** – is the area of scientific study concerned with the mechanical aspect of any system. This provides accurate answers to what is happening, why it is happening, and to what extent it is happening
 - o **static** - the study of factors associated with non moving systems
 - o **dynamics** – the study of factors associated with system in motion
 - **kinematics** – the study of the time and space factors of motion of a system
 - **kinetics** – the study of the forces acting on body that influence its movement
- **Biomechanics**- is the area of study wherein the knowledge and methods of mechanics are applied to the structure and function of the living human system

Introduction

The study of human body has a long history. Our ancestors, who relied on superstitions and notions about magic to help the sick, became so curious about how their bodies worked. Through continuous practice and observation, they began to discover useful ways of treating the human body..

The medical provider and healer coined many new terms to name the body parts, describe their location and to explain their functions. These terms, most of which originated from Greeks and Latin words formed the basis for the language of anatomy and physiology which we relate as scientific names. (Biomechanics, 1990)

Scientist has always been interested in the structure and movement of the human body. The ancient Egyptians are believed to have been the first people to study anatomy. In the middle of the 4th century B.C. Hippocrates, known as the "Father of Medicine", continue these studies in Greece. Aristotle, known to be the "Father of Kinesiology" was the first scientist to describe and analyze the actions of muscle. Galen was the first to introduce the concept of muscle contractions and named such muscles as the agonist and antagonist muscles.

Today, even with the modern technology, scientist continues to conduct research to learn more of the human body and how it works. The science of Anatomy provided us with the knowledge about the structure and function of the human body, while Kinesiology with information about human motion in relation with other sciences such as physiology, physics and neurology. (Fitness, Theory and Practice, 2002)

The Human Body

The body is the most amazing and miraculous living machine in the universe, capable of growth, self repair and reproduction as a result of the monitoring power of the human brain. It is made up of thousands of parts of various sizes and shapes that work together in an organized manner, each of which have a specific functions working together to keep as alive. But, the big question is "What is the human body really made of?"

- **Cell** – are the building blocks of the body. They are the smallest structure of the body that carries out complex processes. It varies in size, shape, color and other depending upon its function. It can divide and multiply. Typically a human cell consists of several compartments of organelles surrounded by plasma membrane. The organelles can be seen floating in fluid called cytoplasm. Each cell contains a nucleus where the genetic material is stored. This coil-like structure is called chromosomes that always comes in pair and are made up of a chemical called DNA (deoxyribonucleic acid) where the genetic materials are stored. Each one of us has 46 chromosomes, from which 23 came from the father and 23 from the mother. This made us unique from others.
- **Tissue** – are group of cells organized into layers or masses that have common function. Cells of different tissues vary in size, shape, organization and function, those within each type are quite similar in function. The tissues of the human body are of four major types
 1. **Epithelial** – cover all body surfaces, line most internal organs, and are the major tissues of glands. The epithelial cells reproduce readily that is why injuries to epithelium heals rapidly as new cells replace lost or damages ones. Examples are the skin, stomach and intestine
 2. **Connective** – binds structures, provide supports and protection, serves as frameworks, fill spaces, store fat, produce blood cells, protect against infections and help repair tissue damage. Examples are the bones, the tendons , ligaments, muscles, adipose tissue or fats, nervous tissues
- **Organs** – are groups of different tissues that form a complex structure with specialized functions like the skin, skeleton, stomach, the heart, kidneys, intestine, muscles, brain, blood etc...

- **Systems** – are group of organs that function closely together that constitute the organism
 1. **Skeletal system** – consist of the bones, cartilage and ligaments that binds bones together. Without the frame to support your body you would collapse, lose your shapes and be unable to move. This body frame is called skeleton. It gives your body strength and protects the soft parts inside. The bones are light enough to allow you to move about easily. They have joints that you can bend to allow the body to do many things. It also produces blood cells and store inorganic salt.
 2. **Muscular system** – consist of the different muscles all over the body. By the contraction and pulling of the skeletal muscles, the muscles provide forces that cause the body to move. They also maintain posture and are the main source of body heat. Your heart beating, your intestine and lungs working are made of muscles
 3. **Nervous system** – consists of the brain, spinal cord, nerves and sense organs. Nerve cells within this organs use electrochemical signals called nerve impulses that carries information between the brain and all parts of the body. The sensory nerve carries signals to your brain from your senses telling what is happening around you. When the brain decided what to do it sends signals along the other set of nerves – the motor nerves that makes your muscles work.
 4. **Circulatory system**- consist the heart, the blood vessels and the blood. The blood is pumped all around your body by the heart. It passes and transport blood through the blood vessels. Arteries used to transport blood away from the heart while the veins trans-

port blood towards the heart, while exchange of gases takes place in the tiny capillaries.

5. **Respiratory System** – consist of the air passages from the nose to the trachea or windpipes, bronchi, to the alveoli or the air sacs of your lungs. The air that you breathe is made up of different gasses, mixed together, but the body only needs one of them, oxygen to keep you alive.
6. **Digestive system** – consist of the mouth that breaks down the food into tiny bits. Then it travels down the esophagus which is connected to the stomach where the digestive process is strongest. Then the food flows down the small intestine. Food nutrients seep through the thin walls into the blood. The large intestine holds the food that the body can not digest. Later it passes out the body through the rectum.
7. **Excretory System** – the organs in several systems absorb and excrete various wastes. The digestive system excrete undigested food through the rectum, the kidney removes waste from the blood in the form of urine. The respiratory system gives out carbon dioxide as waste product while the skin gives out perspiration that even carries salt and fats.
8. **Integumentary system** – includes the skin and its various accessory organs such as the nails, hair, sweat glands, and sebaceous glands. This system protects the underlying tissues, help regulate body temperature, house variety of sensory receptors and synthesize certain products.
9. **Reproductive system** – Reproduction is the process of producing offspring. Cell reproduces when they divide and give rise to

new cells. The reproduction of an organism produces a whole new organism like itself. This consists of the female organs vagina, uterus, ovary, egg and egg tube. The male organs include the penis, testes and bladder.

10. **Lymphatic system** – consist of the lymphatic vessels, lymph fluid, lymph nodes, thymus gland and spleen. This system transports some of the tissue fluid back to the blood stream and carries certain fatty substance away from the digestive organs. The cells of the lymphatic system are called lymphocytes. They defend the body against infection by removing the disease causing microorganisms and viruses from the tissue.
11. **Endocrine system** – includes all the glands that secrete chemical messengers called hormones that help control conditions within the body. They are the pituitary, thyroid, parathyroid, adrenal, pancreas, ovaries, pineal glands and thymus

In the field of Physical Education, the study of anatomy is centered on the systems that are directly involved in movements. The rest of the systems are taken in passing although it plays a very important role in the development of the body and in maintaining fitness and wellness. The said focus is given more on the musculoskeletal, cardio respiratory and nervous systems.

To communicate effectively with same line of thoughts, using the same language specifically the physical educators, coaches, choreographers, dancers and physical therapist, anatomist developed several terms with precise meanings to describe anatomy. Some of these terms concern the relative positions of the body parts. The use of such terms assumes that the body is in anatomical position where the body is standing erect, face forward, the arms at the sides and with palms facing forward.

ANATOMICAL TERMINOLOGY

Relative Positions

The terms relative position described the location of one body part with respect to another which includes the following:

- **Superior** means that a body part is above another part or is closer to the head. (The thoracic cavity is superior to the abdominopelvic cavity).
- **Inferior** means that the body part is below another body part or is toward the feet. (The neck is inferior to the head)
- **Anterior (or Ventral)** – means towards the front (The eyes are anterior to the brain)
- **Posterior (or Dorsal)** – means towards the back (The pharynx is posterior to the oral cavity)
- **Medial** – relates to the imaginary midline dividing the body into equal left and right halves. A body part is medial if it is closer to the line than another part. (The nose is medial to the eyes)
- **Lateral** – means toward the side with respect to the imaginary midline. (The ears are lateral to the eyes)
- **Proximal** – describes a body part that is closer to a point of attachment or closer to the trunk to the trunk of the body than other part. (The elbow is proximal to the wrist)
- **Distal** – means that a particular part of the body is farther from the point of attachment or farther from the trunk than another part. (The fingers are distal to the wrist)
- **Superficial** – means situated near the surface (the epidermis is superficial to the layer of the skin). Peripheral also means outward or near the surface.
- **Deep** – described part that is more internal. The dermis is the inner layer of the skin).

Body Section/ Planes

Observing the various locations and organization of the internal body parts requires cutting or sectioning the body along various planes.

- **Sagittal** – refers to the lengthwise cut that divides the body into right and left portion. If the sagittal section passes along the midline and divides the body into equal parts it is called median (midsagittal)
- **Transverse (or Horizontal)** – refers to the cut that divides the body into superior and inferior portion.
- **Coronal (frontal or lateral)** – refers to a section that divides the body into anterior and posterior portion

Sometimes a cylindrical organ such as the blood vessel is sectioned. In this case, a cut across the structure is called a **cross section**, an angular cut is an **oblique section**, and a lengthwise cut is a **longitudinal section**

THE BODY SYSTEMS

I. THE SKELETAL SYSTEM

The skeleton is made out of 206 bones of different size and shapes. It serves as the framework that holds the whole body together.

THE BONES

The bones are the living structures consisting of several layers. These include thin, membranous outer surface that has a network of nerves and blood vessels running through it. Bones are made up of 35% organic materials of fibrous protein called collagen that gives the bone flexibility. The 65% of inorganic salt and water like calcium and phosphorus that gives the bone strength.

Functions

- The 206 bones of the human body form a rigid framework (skeleton) to which the softer tissues and organs of the body are attached.
- The vital organs are protected by the skeletal system. The brain is protected by the surrounding skulls, as the heart and lungs are encased by the sternum and rib cage.
- Body movement is carried out by the interaction of the muscular and skeletal systems. For this reason, they are often grouped together as the musculoskeletal system. Muscles are connected to the bones by tendons while bones are connected to another bone by ligaments. This bone connection is typically called joints.
- Blood cells are produced by the marrow in some bones. An average of 2.6 million red blood cells is produced each second by the bone marrow to replace those worn out and destroyed by the liver.
- Bones serve as storage area for minerals such as calcium and phosphorus. When an excess is present in the blood, a build up will occur within the bones. When the supply of these minerals is low, it will be withdrawn from the bones to replenish the supply.

Types of Bones

The types of bones are classified on the basis of their form:

- **Long bones** – leg and arm bones
- **Short bones** – wrist and ankle bones
- **Flat bones** – skull, shoulder blade, ribs, sternum and patella
- **Irregular** – bones of the spinal column

The thigh bones or the femur is the largest and strongest single bone in the body, while the smallest bone is called stirrup found in the middle ear connected to two other small bones called hammer and anvil that are joined to the eardrum. This carries sound signals to the brain.

Division of the Skeleton

The human skeleton is divided into two parts:

- **AXIAL Skeleton** – consist of the bones that form the axis of the body and support and protect the organs of the head, neck and trunk.
 1. Skull
 2. Sternum
 3. Ribs
 4. Vertebral Column
- **APPENDICULAR Skeleton** is composed of the bones that anchor the appendages to the axial skeleton.
 1. Upper Extremities
 2. Lower Extremities
 3. Shoulder Girdle
 4. Pelvic Girdle (the sacrum and coccyx are considered part of the vertebral column)

The Axial Skeleton

The Skull

The skull is the bony framework of the head. It is comprised of the eight cranial and fourteen facial bones. The cranial bones make up the protective frame of bones around the brain while the facial bones make up the upper and lower jaw and other facial structures. These are:

• CRANIAL BONES

1. frontal – forms the forehead (1)
2. parietal – forms the roof and sides of the skull (2)
3. temporal – house the ears (2)
4. occipital – forms the base of the skull and contains the foramen magnum (1)
5. sphenoid – is considered the key bone of the skull where all bones are connected to it (1)
6. ethmoid – located between the eyes that forms the part of the nasal septum (1)

• FACIAL BONES

1. mandible – forms the lower jaw and the only moveable joint in the head that provide the chewing motion. (1)
2. maxilla – forms the upper jaw (2)
3. palatine – forms the hard palate or the roof of the mouth (2)
4. zygomatic – are the cheek bones (2)
5. lacrimal – help form the orbits or inner aspect of the eyes (2)
6. nasal – forms the bridge of the nose (2)
7. vomer – form parts of the nasal septum (the divider between the nostrils) (1)
8. inferior concha – bones which makes-up the side wall of the nasal cavity (2)

The Ribs

The ribs are thin, flat curved bones that form a protective cage around the organs in the upper body. They comprised 24 bones arranged in 12 pairs that form a kind of cage that encloses the upper body. They give the chest its familiar shape to protect the heart and lungs from injuries and shocks. The ribs also protect parts of the stomach, spleen and kidneys,

during respiration, the muscles in between the ribs lift the rib cage up to allow the lungs to expand when you inhale. Then, the rib cage moves down again, squeezing the air out of your lungs when you exhale.

These bones of the rib cage are divided into three categories namely:

- **TRUE RIBS** – are the first seven pairs of bones connected to the spine (backbone) and directly to the breastbone or sternum by a strip of cartilage called the costal cartilage
- **FALSE RIBS** – are the next three pairs of bones directly connected to the spine at the back and are attached to the lowest true ribs in front.
- **FLOATING RIBS** – are the last two sets of ribs the spine but not connected to anything in front.

The Sternum

The sternum is a flat, dagger shaped bone located in the middle of the chest from where the ribs are connected to it by the costal cartilage.. It is composed of three parts, the handle called the manubrium, the blade called body and the tip called xiphoid process

The Vertebral Column

The vertebral column also called the backbone or spinal column consist of series of 33 irregularly shaped bones called vertebrae, This 33 bones are divide into five categories depending on where they are located in the backbone.

- **CERVICAL VERTEBRAE** –the first seven vertebrae located on top of the vertebral column. These bones form a flexible framework of the neck

and support the head. The first cervical vertebra is called the atlas which allows the head action for the YES and NO.

- **THORACIC VERTEBRAE** – are the next 12 vertebrae form the anchor of the rib cage. The bones of the thoracic vertebrae are larger than the cervical and increase in size from top to bottom.
- **LUMBAR VERTIBRAE** – these five bones are the largest vertebrae in the spinal column that support most of the bodies weight and are attached to many of the back muscles
- **SACRUM** – is the triangular bone located just below the lumbar vertebrae that consist of four of five sacral vertebrae in a child which fused into a single bone after age 26. This forms the back wall of the pelvic girdle
- **COCCYX** – is also called the tailbone consist of 3-5 bones that are fused together in adult.

The vertebral column turned into 26 movable parts in adults. In between the vertebrae are intervertebral discs made of fibrous cartilage that acts as shock absorbers and allow the back to move. At age 50 to 55 and as the person ages this disc compresses and shrink. Resulting in a distinct loss of height.

Looking at the side, the spine form four curves called the cervical curve, thoracic, lumbar and the final curve pelvic or sacral curve. These curves allows human being to stand upright and help maintain their balance. Any exaggeration on this curves is a problem. Kyphosis, on the thoracic, lordosis on the lumbar and scoliosis on the side curvature

The Appendicular Skeleton

The Upper Extremities

The upper extremity consist of parts, the arm, forearm and the hands

- **ARM** – is the region between the shoulder and the elbow consist of a single long bone called humerus. The humerus is the longest bone in the upper extremity. The top or the head is large, smooth and rounded that fits into the scapula in the shoulder. On the bottom end are two depressions where the humerus connects to the radius and ulna of the forearm.
- **FOREARM** - is the region between the elbow and the wrist. It is formed by the radius on the lateral side and the ulna on the medial side when viewed on anatomical position. The ulna is longer than the radius and connected more firmly to the humerus. The radius however contributes more to the movements of the wrist and hand than the ulna. When the hands are turned over so that the palm is facing downwards, the radius crosses over the ulna.
- **HANDS** – have 27 bones and are consist of three parts, the wrist, palms and fingers.
 1. **Wrist or Carpals** – consist of 8 small bones called carpal bones that are tightly bound by the ligament. These bones are arranged in two rows of four bones each
 2. **Palm or Metacarpal** – consist of 4 metacarpal bones one aligned with each of the fingers. The bases of the metacarpal bones are connected to the wrist bone and the heads are connected to the bones of the fingers that form the knuckles of a clenched fist.

3. **Fingers or Phalanges** – consist of 14 bones called phalanges. The single finger bone is called phalanx arranged in three rows

Lower Extremities

The lower extremities are composed of the bones of the thigh, leg, foot and patella (kneecap). The bones of the lower extremities are the heaviest, largest and strongest bones in the body because they must bear the entire weight of the body when a person is standing in the upright position.

- **THIGH** – the region between the hip and the knee composed of a single bone called femur or thighbone. The femur is the longest , largest and strongest bone in the body
- **LEG** - it is the region between the knee and the ankle. It is formed by the fibula on side away from the body and the tibia or the shin bone. The tibia connects to the femur to form the knee joint. The tibia is larger than the fibula because it bears the weight while the fibula serves as an area for muscle attachment.
- **FOOT** – contains 26 bones of the ankle, instep the five toes. The ankle is composed of 7 tarsal bones the largest of which is called calcaneus or heel bone. The talus rest on top of the calcaneus and is connected to the tibia that allows the ankle to flex and extend
- **PHALANGES or Metatarsal** – bones of the foot are similar in number and position to the metacarpal and phalanges of the hands
- **KNEECAP or Patella** – is a large triangular sesamoid bone between the femur and the tibia. The patella protects the knee joint and strengthens the tendons that forms the knee

The Shoulder Girdle

The shoulder girdle is also called pectoral girdle composed of four bones: 2 clavicles and 2 scapulae. The pectoral girdle serves as an attachment point for the numerous muscles that allows the elbow and the shoulder joint to move. It also provides the connection between the upper extremities and the axial skeleton.

- **CLAVICLE** – is also known as collar bone. It is a slender S-shaped bone that connects the upper arm to the trunk of the body and holds the shoulder joint that allow a greater freedom of movement. One end of the clavicle is connected to the sternum and one end is connected to the scapula
- **SCAPULA** – is a large triangular, flat bone on the back side of the rib cage commonly called the shoulder blade. It overlays the second through the seventh ribs and serve as attachment for several muscles.

The Pelvic Girdle

The pelvic girdle also called the hip girdle composed of coxal bones that support the weight of the body from the vertebral column. This basin-shaped pelvis supports the upper half of your body and protects the soft parts and other body systems. This coxal bone is composed of the ilium, ischium and pubis

The pelvic girdle differs between man and woman. In man the pelvis is more massive and the iliac crest is closer together. In woman, the pelvis is more delicate and the iliac crest is rather apart that reflects the role of women in pregnancy and in the delivery of children.

The Joints

The joints or articulation is the place where two bones come together. There are three types of joints classified according to their degrees of movement.

- **IMMOVABLE or Synarthroses** – in this joint the bones are in a very close contact and are separated only by thin layer of fibrous connective tissue. The sutures are the joints of the skull. The parietal bones are joined by the sagittal suture. Where the parietal bones and frontal bones meet is the coronal suture, the parietal and the occipital is joined by lambdoid suture while the suture between the parietal and temporal is referred to squamous suture. This site is the most common location of the fontanelles on the head of the baby
- **SLIGHTLY MOVABLE or Amphiarthroses** – this joint is characterized by bones that are connected by hyaline cartilage (fibro cartilage). Example: The ribs that are connected to the sternum.
- **FREELY MOVABLE or Diarthroses** – most of the joint in the human body are freely movable which are of six types:
 1. **Ball-and-Socket** – this type has a ball shaped end on one bone that fits into a cup shaped socket of the other bone allowing the widest range of motion including rotation. Example: shoulder and hip joints
 2. **Condylloid** – oval shaped condyle fits into elliptical cavity of another allowing angular motion but not rotation. This occur between the metacarpals (bones in the palm of the hands) and the phalanges (fingers) and between the metatarsals (foot bones excluding heel) phalanges (toes)
 3. **Saddle** – this type of joint occurs when the touching surface of two bones have both concave and convex regions with the shapes of the bones complementing one another and allowing a wide range of movement. Example: only the thumb.
 4. **Pivot** – the rounded or conical surface of one bone fits into a ring of one or tendon allowing rotation. Example: the joint between the axis

and atlas of the neck.

5. **Hinge** – a concave projection of one bone fits the concave depression in another that allows only two movements, flexion and extension.
Example: knee joint and elbow joints
6. **Gliding** – Flat or slightly flat bones move against each other allowing sliding or twisting without any circular movement.
Example: carpals or wrist bone and tarsals of the ankle

Types of Motion

Joints can move in many directions such as:

- **FLEXION** – is the act of bringing two bones closer together which decrease the angle between two bones
- **EXTENSION** – is the act of increasing the angle between two bones that results in straightening motion
- **ABDUCTION** – is the movement of an extremity away from the midline (an imaginary line that divides the body from head to toe)
- **ADDUCTION** – is movement towards the midline
- **CIRCUMDUCTION** – a continuous motion from flexion, extension, abduction, adduction and hyperextension
- **ROTATION** – allows a bone to move around one central axis. A pivot motion when you turn the head from side to side.
- **PRONATION** – the forearm turns the hand so the palm is facing downward
- **SUPINATION** – turns the hand to face upward.

Note:

- The bones of the spine are the vertebrae. On top of the vertebrae are two bones called the atlas and the axis, that fits together to allow the head to nod and turn from side to side.

- The spine can only curve gently, if it bends any farther, it could damage your spinal cord or the nerve cable that carries message to and from the brain
- From the side, the spine looks curved like a letter S. it helps you to stand up straight
- The ribcage have 12 pairs of ribs are attached to the row of bones in your spine.
- Your hip joint is where the end of the thighbones or the femur fits into a socket in your pelvis. This joint helps you to bend your body in almost half
- The arms can only bend at the elbow .The muscles that control the thumb and the fingers begin here. They are attached to the two arm bones, called the radius and the ulna
- Your ankle is a joint, it is made up of bones in the foot and the end of the legs bones called tibia and the fibula

II. MUSCULAR SYSTEM

The Muscles

You have about 650 muscles in your body. While bones give the body structure and support, they cannot move by themselves. Muscles are need for all body movements like walking, running , talking, breathing and others. The three functions of muscles are movement, maintenance of posture, production of body heat and muscles help give our body its shape.

3 Types of Muscles

There are three types of muscle

- **SKELETAL MUSCLES** are connected to the bones. A skeletal muscle fiber is long, cylindrical, multinucleated and contains an alternation light and

dark striations. They are also called voluntary muscles because the movements they produce are under your control that maybe rapid or forceful. Contraction stabilizes the joint.

- **SMOOTH MUSCLES** are long and spindle-shaped with no striation. It is located in the walls of tubular structures and hollow organs such as the digestive tract, the blood vessels and other internal organs except the heart
- **CARDIAC MUSCLES** are involuntary muscles found only in the heart that works nonstop for life. Its contraction occurs involuntarily and is rhythmic and automatic. When the body is at rest the heart generally beats about 60 to 70 times in a minute.

Characteristics of Muscles

The muscles whether they are skeletal, smooth or cardiac have four characteristics in common:

- **CONTRACTIBILITY** – When the muscle shortens or contracts, it reduces the distance between the parts of its content or the space that it surrounds. The contraction of skeletal muscles which connects a pair of bones brings the attachment point closer together which causes the bone to move. When cardiac muscles and other smooth muscles contract they squeeze out the blood causing the surrounding blood vessels to relax and increase in diameter to allow the passage of blood in these tubes and to decrease upon contraction
- **EXCITABILITY (Irritability)** – is the ability of the muscle and the nervous cells (neurons) to respond to certain stimuli by producing electric signals called action potentials or impulses.
- **EXTENSIBILITY** – is the ability to be stretched. Like when the biceps muscle contracts to lift the bone, the triceps muscle then extends or stretched.

- **ELASTICITY** – the ability of the muscles to return in its original length when relaxing.

Muscle Contraction

Skeletal muscle is attached to the bone by long ropy strands called tendon. The skeletal muscles contract or shorten, to move the bones. A muscle only pulls in one direction. It needs another muscle to pull in the opposite direction in order to return a bone to its original position. When you straighten the arm the triceps contracts pulling the biceps back to a relaxed position,

- **ISOTONIC** – when muscles contract they shorten and movement occurs
- **ISOMETRIC** – when the muscles contract but the muscles do not shorten or produce movement...

Muscle Tone

The muscle tone is the state when two muscles work against each other, and is always at the state of slight contraction and ready to pull. Muscle tone is particularly important in maintaining the posture. If the muscles of the neck, trunk and legs suddenly relax, the body collapses.

Oxygen Debt

Oxygen Debt is the condition when we continuously breathe deeply and pant after strenuous exercise or work. This continued intake of oxygen is required to complete the metabolism of lactic acid (acid causing pain to muscles) that accumulated during the exercise.

Naming Muscles.

Muscles are named by location, size, and direction, number of origin, location of origin, insertion and action; however, not all muscles are named in this manner.

- location frontalis (forehead)
- size - gluteus maximus (largest muscles in the buttocks)
- direction of fibers - external abdominal oblique
- number of origins - biceps (two-headed muscles in the humerus)
- location of origin - sternocleidomastoid (origin is the sternum, clavicle. masseter)
- action
 - flexor - flexor carpi ulnaris (flexes the wrist)
 - extensor - extensor carpi ulnaris (extends the wrist)
 - levator - raises or lowers body parts
 - depressor- depresses the corner of the mouth

Skeletal Muscles

The following sets of muscles are those directly responsible in producing major body movements:

- **MUSCLES OF THE NECK**

1. Sternocleidomastoid are large muscles extending diagonally down sides of the neck. Possible movements are flexion, extension and rotation (twist) of the head

- **MUSCLES OF THE UPPER EXTREMITIES**

1. Trapezius is a large triangular muscles located at the upper surface of the back that moves the shoulder and extends the head

2. Deltoid is a thick triangular muscle that covers the shoulder joint. that causes the upper arm to abduct
3. Pectoralis Major is located at the anterior part of the chest that flexes the upper arm and helps and helps to abduct the upper arm.
4. Serratus – is the anterior chest that moves the scapula forward and helps to raise the arms
5. Biceps Brachii – is the muscle located at the upper arm to the radius that helps to flex the lower arm
6. Triceps Brachii – is found at the posterior arm to the ulna that helps extend the lower arm
7. Extensor and Flexor Carpi Muscle Group – are muscles that extend from the anterior and posterior forearm to the hand. This group moves the hand
8. Extensor and Flexor Digitorum Muscle Groups – extends from the anterior and posterior forearm to the fingers. It moves the fingers

- **MUSCLES OF THE TRUNK**

1. External Intercostals - are found between the ribs. It raises the ribs to help breathing
2. Diaphragm - is a dome-shaped muscle separating the thoracic and abdominal cavities. This helps to control breathing
3. Rectus Abdominis – is an abdominal muscle that extends from the ribs to the pelvis that compresses the abdomen
4. External Oblique – is located at the anterior edge of the last eight ribs that depresses the ribs, flexes the spinal column and compresses the abdominal cavity
5. Internal Oblique – is found directly beneath the external oblique with fibers running in the opposite direction that depresses the ribs, flexes the spinal column and compresses the abdominal cavity

• MUSCLES OF THE LOWER EXTREMITIES

1. Gluteus Maximus – is the buttocks muscle that stretches the femur and rotates it outward
2. Gluteus Medius – a muscle that extends from the deep femur to the buttocks and the injection site. Its function is to abduct and rotates the thigh
3. Tensor Faciae Latae - is a flat muscle found along the upper lateral surface of the thigh that flexes abduct and medially rotates the thigh
4. Rectus Femoris – is the anterior thigh that flexes the thigh and extends the lower leg
5. Sartorius – is also called tailor's muscle. It is a long, strap-like muscle that runs diagonally across the anterior and medial surface of the thigh that flexes and rotates the thigh and legs.
6. Tibialis Anterior – is located in front of the tibia bone that dorsiflexes the foot which permits walking on heels
7. Gastrocnemius – is the calf muscle flexes the lower muscles that points the toes
8. Soleus – is a broad flat muscle found beneath the gastrocnemius that extends the foot
9. Peroneus Longus – is a superficial muscle found on the lateral side of the leg that extend and everts the foot and support the arches

Muscle Structure and Size

Muscles will only change in size but not in the number of cells. Muscles that have been injured can regenerate only to a limited degree. If the muscle damage is extensive, then the muscle tissue is replaced by connective tissue (scar) Muscles that are not used will atrophy (shrink in size and reduced in

strength) and those that are used excessively will hypertrophy (increase in size). Muscles that are over exercised or worked will have a tremendous increase of connective tissue between the muscle fiber. This causes the skeletal muscle to become tougher.

Notes:

- The largest muscle in your body is the gluteus maximus located in your thigh and buttocks.
- If you stand on tip toe, you can see the calf muscle in the back of your leg
- The longest muscle in your body is the sartorius muscle in the upper leg
- Some of your arm muscles are attached to the bones in your back. This strong anchor enables you to pick up the heavier things
- The muscle of the hands allows to make a delicate, accurate and powerful movement. Your flexible fingers have many small muscles which are useful for precise job. Your fingers and thumb work together to let you grasp things tightly to support you if you hang on the bar or support your body when the body is on an inverted position on a handstand.
- Muscles are attached to the bones that make them move. They can only pull; they cannot push which is why they always move in pair.

Role of Muscles

Muscles have various role in a given movement which is dependent on the requirement of that movement.. Those roles are designated as prime mover, antagonist, and synergist.

- **MOVERS or AGONIST** – is a muscle that is directly responsible to producing a movement.
 1. **Prime movers** – are muscles that do most of the work to produce movement.
 2. **Assistant movers** – are the muscles that help to perform the movements but seem to be of less important.

- **SYNERGIST** – are muscles that act as neutralizers or stabilizers. These aids in the production of the desired motion use to indicate cooperative muscle functioning in various roles.
 1. **Stabilizer, fixator, supporting muscles** – are the muscles that contracts statically, to steady or support some part of the body against the pull of the contracting muscle, against the pull of gravity or any other force that interferes with the desired movement
 2. **Neutralizer** – is a muscle that acts to prevent an undesired action of the mover,
- **ANTAGONISTS** – are muscles that cause the opposite movement from that of the movers.

Muscle Food

To keep the muscle working properly, you need a diet that includes protein like eggs, cheese, milk and dried beans.

Effect of Training on Muscle Efficiency

- Improved coordination of all muscles involved in a particular activity
- Improvement in the respiratory and circulatory system to supply the needs of an active muscular system
- Elimination and reduction of excess fat
- Improved joint movement involved with that particular muscle activity

Effect of Training on Muscle Strength

STRENGTH (capacity to do work) is increased by proper training. Training can have the following effects on skeletal muscles:

- Increase in muscle size
- Improved antagonistic muscle coordination, where antagonistic muscles

are relaxed at the right moment and do not interfere with the functioning of the working muscle

- Improved functioning in the cortical brain region, where the nerve impulses starts muscular contraction

Common Exercise and Sports Injuries

- **Muscle Strain** – is a tear in the muscle resulting from excessive use. There is a limited bleeding inside that can result swelling and pain (ice pack helps to stop bleeding and swelling)
- **Muscle Spasm (cramp)** - is a sustained contraction of the muscle that may occur due to overuse of muscle. Cramps are caused by the build-up of a waste substance called lactic acid. Too much lactic acid built up in the muscle causes the muscle to contract very sharply and painfully.
- **Rotator Cuff** – is an inflammation of group of tendons that fuse together and surrounds the shoulder joint. This occurs due to repetitive overhead swinging a tennis racket or pitching a ball
- **Shin Splint** – is an injury to the muscle tendon in the front of the shin that occurs in jogging. Using the correct running shoes may prevent such an injury
- **Tennis Elbow** – is an inflamed tendon that connects the arm muscle to elbow.. this may occur carrying heavy luggage, playing tennis or pounding hammer.

Note:

- It is quite important that before you begin to make any strenuous movements, you should always start with a warm up doing gentle loosening-up and stretching exercise.
- It is also important that you end up with a cool-down exercise to relax the

muscle that had been forced to contract during the activities.

- Muscles are able to adapt gradually to the amount of work they have to do, so regular exercise can build them up and make them healthier.

III. CIRCULATORY SYSTEM

The circulatory system is the longest system of the body which includes the following organs:

- **HEART** – is the muscular pump which is responsible for circulating blood throughout the body
- **BLOOD VESSELS** – which includes the arteries, veins and capillaries are the structures that take the blood from the heart to the cells and return blood from the cells back to the heart
- **BLOOD** – carries oxygen and nutrients to the cells and carries the waste products away
- **LYMPH** – return excess fluid from the tissue to the general circulation, The lymph nodes produce lymphocytes and filter out pathogenic bacteria

The Heart

The heart is a four chamber muscular organ about the size of a closed fist that functions as a powerful pump. It is located in the chest between the lungs behind the sternum and above the diaphragm, just to the left of center. The heart continuously pumps blood through the body's extensive network of arteries and veins, delivers oxygen and nutrients and removes waste products.

Chambers

The human heart is divided into right and left halves by the septum and

each half is divided into two parts, thus creating four chambers. The upper chambers are the right and left atrium (auricle) and the lower chambers are the right and left ventricle

Valves

The heart has two pairs of valves that regulate blood flow within. These valves prevent the blood from flowing back as the heart opens and closes during contraction.

- **ATRIOVENTRICULAR or AV** – are valves located between the atria and the ventricle.
 1. **Tricuspid valve** – is a valve with 3 points of attachment positioned between the right atrium and right ventricle. It allows the blood to flow from the right atrium down to the right ventricle.
 2. **Bicuspid** – a 2 point attachment valve located at the left side of the heart, regulating the blood flow from the left atrium down to the left ventricle
- **SEMI-LUNAR Valve** – are valves located where the blood will leave the heart.
 1. **Pulmonary** – is found at the orifice (opening) of the pulmonary artery where the blood travels from the right ventricle into the pulmonary artery then into the lungs.
 2. **Aortic** – is found at the orifice of the aorta. This valve permits the blood to pass from the left ventricle into the aorta to the different body parts.

Sounds

The sound of the heartbeat is created by the two sets of heart valves closing during the cardiac cycle that can be heard through the stethoscope and are described phonetically as “**lub-dub**”. The lub sound is produced by the

closing of the AV valve called systole. The dub sound is made by the closing of the semi-lunar valves known as diastole

Cardiac Cycle

Cardiac cycle refers to the alternating contraction and relaxation of the heart during one heartbeat. It takes about four fifths of a second to complete then repeat continuously. The cycle consist of two phases, in systole the ventricle contract, forcing the blood into the arteries out of the heart. In diastole the ventricle relaxes and fill it with blood,

Blood Circulation

The heart functions as a double pump. Two major functions occur each time the heart beats. The pumping actions occur at the same time. Each time the ventricle contracts, blood leave the right ventricle to go to the lungs to be oxygenated, and the blood leaves the left ventricle to go to the aorta carrying oxygen and nutrients to the cells and tissues.

- **RIGHT HEART** – the deoxygenated blood flows into the heart from the superior and inferior vena cava, to the right atrium down to the right ventricle to the pulmonary artery towards the lungs for the exchange of gases
- **LEFT HEART** – the oxygenated blood from the lungs flows into the heart through the pulmonary vein to the left atrium down the left ventricle, to the aorta to general body circulation

Types of Circulation

- **PULMONARY CIRCULATION** – is the shorter blood circuit where the used blood is pumped into the lungs, picks up oxygen and discard carbon dioxide, then the blood returns into the heart

- **SYSTEMIC CIRCULATION** – occurs when the oxygenated blood returns to the heart and pumps the blood throughout to the different systems of the body and back to the heart

The Blood

The blood contains the red and white blood cells that float inside a liquid called plasma, it also contains thousand of different substances needed in the body .Blood carries all these things around the body and also removes the waste products. It is part of the bodies communication system, that carries chemical messengers called hormones that switch organs on and off as required.

Functions

- **RESPIRATORY** – transporting oxygen from the lungs to the tissues and release carbon dioxide from the tissues to the lungs
- **REGULATORY** - transport hormones and other chemical substances that control the proper functioning of many organs. It also controls body temperature by circulating excess heat to the body surfaces and to the lungs through which it is lost. It maintain water balance and a constant environment for tissue cells
- **NUTRITIVE** – transport nutrient molecules from the small intestine to the tissues
- **PROTECTIVE** – circulate the antibodies and defensive cells throughout the body to fight against infection and disease.
- **EXCRETORY** – transporting waste product like lactic acid, urea and creatinine from the cells to the excretory organs

Blood Cells

In one tiny drop of blood, there are red cells, white cells and platelets, all floating in a liquid called plasma.

- **RED BLOOD CELLS (Erythrocytes)** - transport oxygen to the tissues picks up carbon dioxide away from the tissues and give up carbon dioxide to the lungs.
- **WHITE BLOOD CELLS (Leucocytes)** – are blood cells manufactured in both red marrow and lymphatic tissues. It helps protect the body against infections and injuries
- **BLOOD PLATELETS (Thrombocytes)** - are the smallest of the solid components of the blood. The platelets function in the initiation of the blood-clotting process. The platelets are then stimulated to produce sticky projecting structure creating a platelet plug to stop the bleeding.

Blood Types

The knowledge of one's particular type of blood is important in cases of blood transfusions and surgery. A test called type and cross match is done before giving blood transfusion to test blood compatibility.

There are four main types of blood

- **O** – is the blood type that can only receive type O blood, but is a universal donor to all blood types
- **A** - is a blood type that can receive A and O only but can donate blood to A and AB only
- **B** – is a blood type that can receive B and O only and AB. This letters refer to chemicals on the surface of the red blood cells.
- **AB** – is a universal recipient, that can receive blood type A, B, AB, O but can donate only to AB blood type

The Blood Vessels

Blood flows around your body through a network of tubes called blood vessels. There are three types of blood vessels namely arteries, veins and capillaries.

- **ARTERIES** – carries oxygenated blood away from the heart to the capillaries except the pulmonary arteries that carries deoxygenated blood from the heart to the lungs. Because the blood in arteries comes straight from the heart and is pumped under pressure, so the artery walls are thick and muscular
- **VEINS** – carries deoxygenated blood away from the capillaries, towards the heart. Because the pressure is now lower, the veins have thinner wall than the arteries.
- **CAPILLARIES** – are the smallest blood vessels where the exchange of gases and nutrients takes place. It is so narrow that the RBC has to squash themselves up to pass through

Pulse

The pulse is a throbbing beat that can be felt on the inside of your wrist and in the side of your neck. It is the alternating expansion and contraction of an artery as blood flows through it.

Heart Rate

The heart rate is the number of times that the heart contracts in a minute. The practical ways of taking your pulse rate is by finding the pulse on your wrist or neck and gently holding your fingers (the index and middle fingers) on it and counting the number of beats per minute.

Blood Pressure

When the heart pumps blood into the arteries the surge of blood filling the vessels create pressure against the wall. The pressures measured at the moment of the contraction is the systolic pressure while the lessen force of the blood measured when the heart relax is the diastolic pressure. The average blood pressure is recorded as 120/80 with a normal pulse pressure of 40

IV. Respiratory System

The body requires a constant supply of energy for the cells to perform their many chemical activities. Oxygen facilitates the release of energy stored in nutrient molecules. It must be in constant supply to the body because without oxygen a human being can live no more than few minutes at best.

Functions

- Provide the structures for the exchange of oxygen and carbon dioxide in the body through respiration
- Responsible for the production of sounds through the larynx that contains the vocal cord. When air is expelled from the lungs it passes over the vocal chord and produces sounds

PATHWAYS OF RESPIRATION

When you breathe you draw air into the nose and into the lungs. Air travels down from the nose to the pharynx, the larynx, down to the trachea or the wind pipes those branches out to bronchial tube to smaller branches the bronchi, the bronchioles to the air sacs called alveoli. The oxygen is absorbed through the thin walls of the alveoli and releases carbon dioxide to be breathed out as waste product.

The Lungs

The lungs are two fairly large, cone-shaped organs filling up the two lateral chambers of the thoracic cavity. The lung tissue is porous and spongy, due to the alveoli and the large amount of air it contains the alveoli is about 0.2mm across. The walls of the alveoli are very thin so oxygen and carbon dioxide can easily pass through. There are 300 million estimated numbers of alveoli in the lungs.

Breathing Process

Most of the breathing in the lungs is caused by the contraction of a sheet of muscle called diaphragm. This curved muscle sheet separates the content of the chest from the abdomen. When you inhale the ribs are lifted upward outward, the diaphragm contracts and flattens, the size of chest increases which causes the pressure of the lungs to drop, so air rushes in. When you exhale the ribs move down the diaphragm relaxes, it becomes curved again and forces the air out of the lungs.

The breathing process becomes faster and deeper when you exercise in order to get more oxygen. This helps break down the sugar and provide more energy for the muscles to work.

Normally you only breathe out about 10% of the air in your lungs. But when you are panting very hard or running you may use about 60% of the air. Yet 20% will always be permanently trapped in the alveoli

It is harder to breathe at high altitude because the air is thinner so there is less oxygen in it. While under water the pressure of the water would prevent the lungs from expanding enough to draw the air in.

Most healthy people can hold their breath for about 60 to 90 seconds but it soon becomes very uncomfortable. Because breathing is a normal process, we never think about it. If you try to hold your breath you can override this process only for a while but the brain will not let carbon dioxide build up too much and will soon force you to breathe.

IV. NERVOUS SYSTEM

The nervous system is the body's main communication network, helping all the body systems to work properly. It is made up of billions of tiny cells that carry electrical signals throughout the body. It consists of:

- **CENTRAL NERVOUS SYSTEM** – consists of the brain which contains more than 12 billion active nerve cells and the spinal cord, which extends from the base of the brain all the way down to your back. It is protected by the rings of your bone in your spine. Together, they act as the central processing unit, collecting information from every part of the body. The messages flow around the body through a highly complex system of nerves, while some information is acted on immediately, others are stored.
- **PERIPHERAL NERVOUS SYSTEM** – is the network of small nerves that extends to all parts of the body. It comprises cranial nerves that emerge from the brain and spinal nerve in the spinal cord.
- **AUTONOMIC NERVOUS SYSTEM** – includes peripheral and ganglia or the group of cell bodies outside the central nervous system that carry impulses to involuntary muscles and glands.

Nerves carry messages of sensation, proprioception and movement instructions to muscles. Some impulses are so fast that they do a loop on the spinal cord sending back an instant message to the muscle (reflexes).

Nerves also extend messages to the internal organs to keep lungs, heart, digestive system, reproductive and other organs working and responding properly. The nerves that control these involuntary activities form the unconscious autonomic parts of the nervous system.

Nerve Cells

Nerve cells or neurons make up the nerves that carry messages around the body. They have a star-shaped body containing the cell nucleus with a thread-like fiber called the axon. The tip of the axon is branched and touches other neurones to which it delivers messages or nerve impulses. Neurones have many smaller threads and branches called dendrites which receive other messages from other neurones.

Types of Nerve Cells

There are three types of neurones with different functions

- **MOTOR NEURONES** – are neurones that control muscle work
- **SENSORY NEURONES** – are neurones that carry messages from the sense organs
- **CONNECTOR NEURONES** – are those that pass messages between different parts of the nervous systems

Synapse

SYNAPSE is the point where the tiny bulb on the tip of a nerve fiber contacts another neurone. It is a point where transmitter substance carries the electrical signal from the neurone to the next.

Nerve Impulse

NERVE IMPULSE is like a very simple message either on or off. Because there are so many neurones connected to one another, this simple signal is enough to carry the most complicated messages throughout the whole of the body's nervous system

As a nerve impulse arrives at the junction between two nerve cells, it is carried across the gap or the synapse by the chemicals called neurotransmitters. These contact sensitive areas in the next nerve cell, and the nerve impulse is carried along.

Reflex Movement

REFLEXES are automatic reaction that takes place without your needing to think about them. Like if you prick your finger, you jerk your arm instantly even before your brain becomes aware that some damage has taken place. These reflexes take place in the spinal cord where instructions are given to the muscles to pull your arms away as soon as the nerves have detected pain or damage. Reflexes also take place in the body maintaining normal conditions. Like when food enters the stomach the flow of digestive juice immediately starts. Another example is the blink when dirt enters in your eye and tears flows out to cleans the eye

The Brain

THE BRAIN is the largest organ of the central nervous system and the body's control center. It coordinates all the messages that pass through the nervous system, giving as the ability to learn reason and feel. It also controls the body's automatic functions such as breathing, heart beat, digestion growth and blood pressure. The bony cranium that surrounds the brain is cushioned by

three layers of tough membranes called the meninges. They are filled with liquid in which the brain floats. The cavities inside the brain are filled with the same liquid so that the soft tissue does not flap about. The brain tissue has three main layers

- **Inner layer which surrounds the ventricle** consist of nerve cells that controls instinctive behavior
- **Middle layer of white matter** consist of primary nerve fibers control instinctive behavior
- Outer surface layer called the **cerebral cortex or gray matter** which consist of layers of nerve cells that controls conscious thought, movement and sensations

Parts of the Brain

The brain is divided into three main regions each with different function.

- **CEREBRUM** – is the part of the brain that gives you your intelligence and emotions. It makes up almost 90% of the brain's tissue. Its grey surface is made up of millions of nerve cells. The white layers beneath is mostly made of the nerve fibers connecting them. A narrow strip across the top of cerebrum called the cerebral cortex is concerned with organizing your movement. Another part of the cerebrum is the sensory cortex, where senses such as touch, vision and hearing are controlled. This part shows the relative importance of some of our senses. A large part of the cerebrum is concerned with the hands, eyes and mouth because they are highly sensitive areas.
- **CEREBELLUM** – is the smaller hemisphere that sits below the cerebrum. It controls posture, balance, maintenance of muscle tone and muscle coordination. Fine movements are possible because the cerebellum filters

instruction from other parts of the brain. It monitors these instructions and insures that the muscles work together. This part of the brain is well understood. Its neurones are arranged in a regular pattern that makes it possible to trace the electrical circuit from one neurone to another.

- **BRAIN STEM** – connects the brain to the spinal cord. The brain stem is sometimes called the oldest, part of the brain. This is because it keeps the whole body alive. Even if the other parts of the brain are destroyed, the brain stem often keeps a person alive for some time. It contains the mid brain controls eye and hearing reflexes and conduct impulses that controls the sleep-wake cycle. the pons controls respiration, chewing and taste and the medulla that controls crucial function of the heart, lungs, stomach and blood vessels

The Spinal Cord

The spinal cord continues down from the brain. Like the brain it is submerged in cerebro-spinal fluid and is surrounded by the three meninges. The gray matter in the spinal cord is located in the internal section and the white matter composes the outer part. The spinal cord functions as a reflex center and as a conduction pathway to and from the brain

VI. PHYSICS OF LIFE

Terminology

- **MOTION** is a change in position in a certain amount of time.
- **SPEED** is the rate at which an object moves. A speed that does not change is called constant speed. Average speed is the ratio of distance traveled

- **VELOCITY** is speed in a given direction
- **ACCELERATION** is the rate of change in velocity.
- **MOMENTUM** Is equal to the mass of an object and the velocity with which it is traveling. All moving objects have momentum and the more momentum an object has and the harder it is to stop. The total momentum of an object remains the same unless outside force act on it The momentum lost by one object is gained by another (Conserved momentum)
- **FORCE** is either a push or a pull. It gives energy to an object causing it to start moving, stop moving or change direction.
- **FRICTION** is a force that acts in a direction opposite to the motion of the moving object. Friction will cause a moving object to slow down and finally stop.
- **GRAVITY** is the force of attraction that exists between all objects in the universe.
- **WEIGHT** is a measure of the of the force of gravity on an object.. (gravitational force)
- **MASS** is a measure of the amount of matter in an object.
- **PROJECTILE** is a motion when objects are thrown or shot through the air which can either be horizontal or vertical.
- **PRESSURE** is a force that acts over a certain area.
- **WORK** is a product force applied to an object times the distance through which the force is applied
- **POWER** is the rate at which work is done

NEWTON'S LAW OF MOTION

When ever you describe something that is moving, you are comparing it with something that is assumed to be stationary. The Newton's Law of Motion explains the principles of better performance.

First Law – An Object at rest remains at rest and an object in motion will remain in motion unless acted upon by an outside force.

- Force is used any time an object begins moving, stops moving or change direction
- Force can slows down or make it move fast.
- Speed is a measure of how fast or how slow an object moves
- Speed changes when the motion of an object changes called acceleration.

Example: In serving volleyball, simply holding it with one hand will not put the ball in flight unless you hit it forcefully with the other hand. And it will not return back unless another player hit back.

Second Law – The greater the mass of an object the greater the force is needed to accelerate it. The greater the force given to an object the greater the acceleration

- This explains that the size of acceleration depend on the strength of the force and the mass of the object.
- Near Earth's surface, gravity causes the falling object to accelerate, and all objects accelerate at the same rate regardless of mass
- Air resistance acts in the opposite direction that in which the object is moving
- Any object thrown or shot horizontally or vertically through the air is called projectile. The horizontal velocity is constant while the vertical velocity which is affected by gravity is accelerated.
- When an objects moves along a circular path it is accelerated towards the center of the circle
- When an object is influenced only by gravity the object is said to be free fall so it should be free from gravity.

Third Law – For every action, there is an equal and opposite reaction.

- The forces in an action reaction pair are always equal in size and opposite in direction.
- All moving objects have momentum. The momentum of objects is the product of its mass and velocity.
- The total momentum of a set of objects is conserved unless a net force acts on the set.

The Newton's Law of Universal Gravitation

This law states that all the objects in the universe attracts each other by the force of gravity. The size of the force depends in two factors: the mass of the object and the distance between them.

Pressure and Gravity

As a result of gravity, the pressure a liquid exerts increases as the depth increases. Air pressure decreases as altitude increases.

Buoyancy

Buoyancy is the phenomenon caused by the upward force of the fluid pressure.

- The buoyant force of an object is equal to the weight of the fluid displaced by the object.
- An object float in the fluid when the buoyant force on the object is greater than or equal to the weight of the object.
- An object will float in a fluid if its density is less than the density of the fluid.

Machine

Machines are device that makes our work easier to do. It can increase a force or change the direction of the force

A machine changes either the size or direction of an applied force

- Effort force is force applied to a machine. The work put into the machine is work input
- Work that comes out of the machine is work output. Work output over comes the resistance force.
- Efficiency is the comparison between the work output and the work input
- The mechanical advantage is the amount a machine can increase its force

Simple Machines

- **Lever** is a rigid bar that is free to move about a fulcrum when an effort force is applied. There are three classes of levers depending upon the locations of the fulcrum, the effort force, and the resistance force
 1. **First Class Lever** – the fulcrum is between the effort arm and the resistance arm
 2. **Second Class Lever** – the resistance arm is between the fulcrum and the effort arm
 3. **Third Class Lever** – the effort arm is between the resistance arm and the fulcrum.
- Pulley is a chain, belt or rope wrapped around a grooved wheel. a fixed pulley changes the direction of an effort force
- Inclined Plane is a slanted surface.
- Wedge is a moving inclined plane

- Wheel and axel is a simple machine made up of two circular objects with different diameter
- Screw is an inclined planned wrapped around a cylinder.

Energy

Energy is the ability to do work.. Energy appears to have many forms.

- **Mechanical energy** – is associated with motion like when you walk, ride a bike or hit a ball and the blood flowing through your blood vessels
- **Heat Energy** – the atoms that are constantly moving produces energy. The faster the particle moves the more heat energy is produced. As when you rub your hands using friction convert the mechanical energy into heat energy
- **Chemical energy** – energy is required to bond atom, when the bonds are broken it produces energy. When you digest food bonds are broken to release energy for you to use

Kinetic and Potential Energy

- **Kinetic Energy** is energy of motion. This type of energy is dependent on both mass and velocity. Example: a tossed ball that hit you may not hurt much, not like when the ball came from a spike.
- **Potential energy** is energy of position or shape. Example: In Archery, the bow has a potential to send an arrow gliding towards the target

VII. MAINTAINING HEALTH

Health

Being healthy involves far more than simply not being ill. Health as defined by the WHO is the state of complete physical, mental, social and emotional well-being of an individual and not merely the absence of disease or infirmity. If you feel in good health, your organs will be working properly and you will have the energy to live life to the full. This feeling of wellbeing affects your mind and your body.

PHYSICAL FITNESS

Physical fitness is an important part of health, and this means that your heart, lungs, skeleton and muscles all work together smoothly to carry out your daily activities.

Generally, physical fitness is defined as the ability of an individual to perform regular day to day activities without undue fatigue and still has the energy to enjoy leisure and to meet emergencies.

Basic Fitness Components

There are two basic fitness components. These are the health-related and skill-related components. The health-related fitness component pertains to the total functioning of the body. The skill-related fitness component refers to the quality of movement of one's skills.

• Health-Related Fitness

1. **Cardio-respiratory Endurance** – The ability of the heart and the lungs to function efficiently and effectively over a prolonged period of time.

- 3min-Step Test

2. **Muscular Strength** – The amount of force that particular muscle group can generate to work against resistance
 - Bent Knee Curl-ups
 - Push-ups /Bent-Knee Arm Push-up
3. **Muscular Endurance** – It is the ability of a muscle group to perform minimum resistance in a maximum repetition or to stabilize a fixed contraction (isometric) for a prolonged period of time.
 - Flexed Arm Hang
4. **Flexibility** – It is defined as muscle suppleness to accommodate the full range of motion available at a joint.
 - Sit and Reach
5. **Body Composition** – This refers to the relative amount of fats and lean body tissue or fat free mass (muscle, bones and water) that comprise the body.
 - Skinfold Test

• Skill-Related Fitness

1. **Balance** – The process of orienting yourself in space which involve muscle reflexes, visual cues and reaction time for the maintenance of equilibrium. It can either be static or dynamic balance.
 - Static balance – One-Leg-Balance (Closed Eyes)
 - Dynamic balance – Leap and Pick
2. **Coordination** – The ability to shift smoothly the body or parts of the body from one motion or position to another.
 - Wand Juggling
3. **Agility** – The ability to move the entire body accurately to a sudden change of a direction.
 - Shuttle Run

4. **Speed** – It is the ability of the body to perform any movements in the shortest possible time.
 - 50 meter Sprint
5. **Power** – It is the ability to transform energy into an explosive force that will cause the body to move as fast or spring about.
 - Standing Long Jump
 - Vertical Jump
6. **Reaction Time** – It is the time needed for a muscle group to move in response to a given stimulus called reflexes
 - Ruler drop.

Exercise

Exercise is a physical activity that is planned, structured, repetitive and purposive in the sense that improvement or maintenance of physical fitness is an objective.

Basic Parts or Phase of an Exercise Program

1. Warm –up
2. Exercise Proper
 - Strength
 - Flexibility
 - Endurance
3. Cool Down

General Principles of Exercise

1. Overload
 - Intensity
 - Duration

- Frequency
2. Specificity
 3. Individuality
 4. Recovery
 5. Reversibility

Note

- Exercise is important because it keeps the bones, joints and muscles healthy. You cannot expect an older person to take vigorous exercise but they are encourage for guided workout
- Carefully planned and performed exercises helps prevent joint and muscle injuries
- Walking and even swimming helps the circulation and keeps the joint supple.
- Follow professional advice on proper exercise level to avoid any damage to their body particularly that of those who are under medical treatment.
- Regular exercise helps you tone up the muscles and the circulatory system.
- Regular exercise strengthens the muscles and improves muscle tone.
- Regular exercise can improve body shape and posture
- Regular exercise strengthen the heart and improves your blood flow
- Regular exercise promote sound sleep and rest.

PART II – ANALYZING TEST ITEMS**Competency No.1 Analyzing body parts in relation to movement.**

1. The degree of motion at a joint is determined by:
 - A. the amount of synovial fluid in a joint
 - B. the number of bursa around a joint
 - C. the bone shape and joint structure
 - D. the unusual amount of exercise

The correct answer is **C**

The joint is a point where two bones meet. They are classified into three main types according to the degree of movement: They are immovable, partially movable and the freely movable. The skull has an immovable joint that protects the brain, eyes and ears. The rib cage are slightly movable that helps in the breathing process while the shoulder, hip, elbow and knee joints allows a wider degree of movement.

Competency No.2 Identify components of Physical Fitness

2. The lasting power of the heart, lungs and skeletal muscle as a result of regular exercise such as walking jogging, swimming and aerobic dancing is referred to as
 - A. Flexibility
 - B. Strength
 - C. Power
 - D. Stamina

The correct answer is **D**

Stamina refers to the ability of the body to exert energy for extended period of time. Stamina is derived from a combination of cardio-respiratory and muscular endurance acquired from regular aerobic exercise that strengthen the heart and increased lung capacity.

Competency No. 3 Demonstrate lifetime wellness program and activities

3. When the body systems work together smoothly to carry out your daily life activities, you are said to have:
 - A. Strength
 - B. Physical Fitness
 - C. Full of energy
 - D. Healthy lifestyle

The correct answer is **B**

Physical Fitness is an important part of health which simply mean that when there is a smooth relationships with the work of you body systems, you are fit And keeping fit will help you lead a more active life.

4. Walking is an example of
 - A. Catalyst
 - B. Kinetic energy
 - C. Matter
 - D. Potential energy
5. Forward movement of a part of the body in a plane
 - A. Insertion
 - B. Obstruction
 - C. Protraction
 - D. Extension
6. When Joe White put out his arm to receive money from his father which pair of action are involved
 - A. pronation and rotation
 - B. flexion and abduction
 - C. flexion and inversion
 - D. extension and supination
7. The component of a second-class lever are positioned in this sequence
 - A. Pivot , resistance, effort
 - B. Resistance, pivot, effort
 - C. Pivot, effort, resistance
 - D. Effort, pivot , resistance
8. The carpometacarpal joint of the thumb
 - A. Saddle joint
 - B. Pivot joint
 - C. Hinge joint
 - D. Gliding joint

9. The longest and strongest bone in the body
 - A. Humerus
 - B. Tibia
 - C. Femur
 - D. Fibula
10. The muscle in the upper arm used as the injection site
 - A. Biceps
 - B. Deltoid
 - C. Triceps
 - D. Trapezius
11. Muscle fatigue is caused by a built-up of
 - A. ATP
 - B. Oxygen
 - C. Lactic acid
 - D. Glycogen
12. The strongest muscle of the body is the buttocks also called
 - A. Gastrocnemius
 - B. Trapezius
 - C. Gluteus
 - D. Rectus femoris
13. The biggest part of the human brain consisting of the frontal, parietal, temporal and occipital lobe
 - A. Cerebellum
 - B. Midbrain
 - C. Cerebrum
 - D. Brain stem
14. The nerve which contains fibers that both send and receive messages
 - A. Afferent nerve
 - B. Efferent nerve
 - C. Mixed nerve
 - D. Sensory nerve
15. The blood type found in the largest percent of the population
 - A. Type AB
 - B. Type A
 - C. Type B
 - D. Type O
16. The valve between the right atrium and the right ventricle that prevents the back flow of blood
 - A. Tricuspid valve
 - B. Aortic semi-lunar valve
 - C. Bicuspid valve
 - D. Pulmonary semi-lunar valve
17. The blood circulation that carries blood from the heart to lungs & back to heart
 - A. Coronary
 - B. Fetal
 - C. Cardiopulmonary
 - D. Portal
18. The blood vessel that carries blood away from the heart to the lung
 - A. Pulmonary artery
 - B. Pulmonary vein
 - C. Aorta
 - D. Vena cave
19. In archery, the amount of pull given to the bow will determine the speed and distance of the arrow upon its release.
 - A. First Law of Motion
 - B. Second Law of Motion
 - C. Third Law of Motion
 - D. Newton's Law of Gravitation
20. The type of bone that usually functions as a lever
 - A. Flat bone
 - B. Short bone
 - C. Irregular bone
 - D. Long bone
21. The blood flow to the brain during moderate exercise
 - A. Increases
 - B. Decreases
 - C. Remains unchanged
 - D. Initially increase then decreases
22. A person's blood pressure is generally taken with a cuff around the humerus
 - A. The subclavian artery
 - B. The humeral artery
 - C. Brachial artery
 - D. Radial artery
23. Lifting a 2 lbs dumbbell with one arm is like a
 - A. Third class lever
 - B. First class lever
 - C. Second class lever
 - D. Inclined plane
24. The force that pushes your body off the water in swimming is
 - A. Gravity
 - B. Hydraulics
 - C. Pressure
 - D. Buoyancy
25. Dribbling as a require skill in basketball proves the Newton's Law of Motion
 - A. First Law of Motion
 - B. Second Law of Motion
 - C. Third Law of Motion
 - D. Newton's Law of Gravitation

Principles, Strategies and Coaching and Officiating Techniques

Prepared by:
Prof. Julio Victor B. Santarin

Competencies:

1. Apply Concepts, Principles and Techniques in Coaching and Officiating Sports Events
2. Exhibit positive values in the performance of Duties and Responsibilities

PART I - CONTENT UPDATE

Coaching is a craft that is best learned through practical experience, developing effective relationships with athletes and by application of knowledge. Knowledge is the foundation for all coaches whether beginning or practicing coaches as long as they are seeking improvement.

I. Philosophy – simply the manner you see facts and the things you gain in life

What is coaching? The word “coaching is the most frequently utilized to include a wide range of activities, usually to help somebody prepare for something. Coaching in sports has been depicting as the original condition of support to an athlete or a group of athletes to assist them to develop and improve performance. Coaching involves teaching, training, instructing and others. It also recognizing, understanding and supplying for the other needs of athletes such as social and emotional as well as more apparent needs related to sport and competition.

The roles of a Coach – As a coach you will perform many functions that some will be willingly and others may not that desirable, but still it is equally important. All these work or responsibilities contribute to being a successful coach.

Ask yourself “do I or can I act”:

1. As a teacher – teaching knowledge, skills and ideas
2. As a trainer – enhancing fitness
3. As an instructor – directing activities and practices
4. As a motivator – create a positive and decisive approach
5. As a disciplinarian – establishing a system of rewards and punishments
6. As a manager – systematize and preparation

7. As an administrator – attending to paper work
8. As a publicity agent – work out with the media
9. As a social worker – psychoanalysis and advising
10. As a friend – supporting and follower
11. As a scientist – investigate, evaluating and problem solving
12. As a student – ready to pay attention, study and seek for brand new knowledge

• **Comparison of the Three Major leadership Styles**

LEADERSHIP STYLE

	AUTHORITARIAN	COOPERATIVE	CASUAL
Philosophy Objectives	Win centered Task objectives	Athlete centered Social and task objectives	No emphasis No objectives
Decision making	Coach makes all decisions	Decision are guided by coach, but shared	Athletes makes decision
Communication style	Telling	Telling, asking, listening	Listening
Communication development	Little or none	high	None
What is "winning"	Judge by coach	judge by athlete and coach	Not defined
Athlete develop- ment	Little or no trust in the athlete	Trust in the athlete	Trust not shown
Motivation	Sometimes motivates	Motivates all	No motivation
Training structures	In flexible	Flexible	None

• **Philosophy in action –**

1. Why do you coach?
2. How do you like your athletes portray you?
3. What coaching style do you mostly use?
4. What is the most important area you must develop to be a better coach?

II. Anatomy and Physiology – Knowledge of the basic structures of the body and how they functions together.

1. **Cell** – Building block of life. All living things are made up of millions of cells. It makes up our skin, bones, muscles and brains, and all other parts of the bodies. All the things we do involves cells of different shapes and sizes working together. There are several types of cell or group of cells task to do different job. resulting to different looks, some cells are designed to:

- **Carry messages** – nerve cells transport electrical messages
- **Carry chemicals** – red cells in the blood transmit oxygen around the body
- **Support the body** – bone cells build up the skeleton
- **Move the body** – muscles cells generate forces

Each cell has its own function, they live, grow and die, to be replaced by new cells.

2. **The Skeleton** – is a system of bones and other supporting materials which functions to :
 - It gives support to the body like the frame work of a building
 - It gives protection to vital and fragile organs of the body.
 - It provides anchorage for muscles to move not only in parts but also the entire body with precision and control.

In the human body there are over two hundred bones. Some are long, some short, some round, some flat, but all bones have the same basic structure.

3. **Muscles** – use to control movements consisting of bundles of long, thin cells called muscles fibers. At each end of the muscles all these linking sheaths join together molding into tendons which attached the muscle to the bone. Movement is triggered by muscles pulling on a bone. Muscles can only pull, they cannot push. This is why muscles are arranged in opposing pairs. When one muscle tenses and contracts, its partner relaxes and stretches to allow movement. If both muscle groups contract at the same time and with equal force the joint is fixed and there is no movement.

Muscles Fiber types:

- Fast twitch fibers
- Slow twitch fibers

How Muscles Pull

- Dynamic contractions result in a change in muscle length and movement at a joint or joints.
- Static contractions or sometimes called the isometric contraction where there is not lengthening or shortening of the muscles.

4. **The Nervous System** – getting information from Place to Place
Muscle pulls the moment they receive signals from the brain telling what to do. These signals carried by special nerves cells. The nervous system is the central network which includes the brain, spinal cord and the other nerves that branch from the spinal cord to all parts of the body. THE nervous system indicate to the muscles determines the number of fibers that contract. When a light load is placed on a muscle only few fibers of the entire muscle need to contract to do the task. As the load increases more and more muscles fibers must indicate to contract.
5. **Energy system** – There are three energy systems operating in the bodies of the athletes.
- **Aerobic System** – the muscles energy system which requires oxygen.

- **Anaerobic Alactic System** – The stored start up system which does not require oxygen and does not produce lactic acid.
- **Anaerobic Lactic System** – The system that not requires oxygen but produces lactic acid.

6. **The cardio respiratory system** – accountable for getting oxygen, fuel and nutrients to the performing muscles. It is made of the lungs, the heart, the blood vessels and blood
- Lungs – getting oxygen to the blood
 - Heart – life pump
 - Blood vessels and the blood – the transport system:
 1. Carrying oxygen from the lungs and food from the digestive system to the cells of the body. Red cells in the blood carry oxygen.
 2. Carrying carbon dioxide from the cells to the lungs where it is removed and breathed out of body.
 3. Carrying waste materials from the body tissues to the kidneys where they are excreted.
 4. Preventing infection by healing wounds and fighting germs.
7. **Individual Difference** – individuals appear in all shapes and sizes which are categorized into three body types. These are:
- **Endomorph type** – these individuals tend to have a less well defined body outline and can become fat very easily
 - **Mesomorph type** – individuals who are perfectly proportioned and muscular
 - **Ectomorph type** – thin individuals who likely to be tall
8. **Body Composition** – refers to the relationship between lean body weight and excess fat.

III. Biomechanics – Knowledge of what produces movement and to analyze movement

1. **Force** – is simply a pull or push
2. **Linear Motion** – movement along a straight line
3. **Rotational Motion** – movement is usually about an axis of rotation
4. **Velocity** – how fast a thing is moving and in which direction
5. **Acceleration** – how fast the velocity of something is changing
6. **Momentum** – quality of motion a body has and is a product of weight and velocity
7. **Laws of Motion**
 - **Newton's First Law of Motion** – All bodies continue in a state of rest or uniform motion in a straight line unless acted upon by an external force
 - **Newton's Second Law of Motion** – The acceleration of a body is proportional to the force causing it and takes place in the direction the force acts.
 - **Newton's Third Law of Motion** – To every action, there is an equal and opposite reaction
8. **Center of Gravity** – is a force which is always present and is pulling force in the direction of the center of the earth.

IV. Growth and Development – knowing the period that take place to come up with decision of identifying the physical needs of the individual.

1. **Physical Development**
 - Patterns of Growth – changes in proportions
 - Pattern of Growth – change in size

- Growth spurt
 - Difference between boys and girls
 - Early and Late developers
2. **Structure of the Body** – from cartilage to bones especially in the growth plates
 3. **Children and Exercise** – the younger the athlete the harder their bodies must work to provide oxygen their muscles need.
 - Implication to Coach
 - a. Think about the growth stages rather than ages
 - b. Think how changes in physical proportions will affect performance
 - c. Help children understand the changes taking place in their bodies
 - d. Set standard of performance according to developmental age not chronological age
 - e. Group children according to physical development, using height and weight as a guide
 - f. Encourage skill learning for all your athletes; late developers could be very successful later
 - g. Don't use exercise which place excessive force on the bone growth regions during periods of maximum growth
 - h. Avoid weights before adolescence
 4. **Developing Control of Movements**
 - What determines Children's Skill
 - Maturation
 - Experience
 - Teaching
 - Difficulty of the task
 5. **Children's basic movements**
 - How to help children learn
 - Children's basic capabilities

6. **Principles for Structuring Practice**
 - Big movements before Small movement
 - Simple to Complex
 - Parts and Whole
 - Continuous Practice or Broken Practice
 - Practice and competition Conditions
 7. **Social Development**
 8. **Self – Image**
 - How Children See Themselves
 - Influence of Others
 - The Influence of Parents
 - The Influence of Other Children
 - Influence of the Coach
 9. **Ability and Effort**
 - When mistakes happen
 10. **Play, Sport and Competition**
 - Children's play
 - Adult play
 - Children's understanding of Competition
 11. **Adapting Sports for Children**
 - Modifying Techniques
 - Adapting Equipment
 - Modifying Rules
- V. Training Theory** – putting together all information about sports from social and scientific sources.
1. **What is Fitness?** Is how well a person is tailored to and competent of living a confident survival?
 2. **Law of Overload** – causes fatigue, and recovery and adaptation allow the body to overcompensate and reach higher level of fitness.
 3. **Law of Reversibility** – “If you don't use it, You lost it”
 4. **Law of Specificity** – the specific nature of a training load produces its own specific response and adaptations.
 - Summary of Training Principles
 - a. The body is capable of adaptation of training loads.
 - b. Training loads of correct intensity and timing cause overcompensation.
 - c. Training loads that increases progressively cause repeated over compensation and higher level of fitness.
 - d. There is no increase in fitness if loading is always the same or too apart.
 - e. Overtraining, or incomplete adaptation, occurs when training loads are too great or too close.
 - f. Adaptation is specific to the specific nature of the training.
 5. **Principle of Individualization**
 - The Individual's Response to Training – each individual is unique.
 - Heredity – athletes inherit physical, mental and emotional characteristics from their parents.
 - Developmental Age – each athlete is unique.
 - Training Age the number of years an athlete has trained.
 6. **Principle of Variety** – different training load
 7. **Principle of Active Involvement** – the athlete must want to actively and willingly participate for the training program to be effective
 8. **Bio-motor abilities**
 - The components of fitness
 - a. **Strength** – the ability of the body to exert force

- b. **Endurance** – the ability to perform work on a given intensity over a period of time
- c. **Speed** – the capacity to travel or move very quickly
- d. **Flexibility** – is the ability to perform joint actions through a wide range of motion
- e. **Coordination**

9. Planning the Training Program

10. Periodization

- **Volume and Intensity**

Volume refers to the quantity of training. The total of all exercises, repetitions, and other activities being done during training proper such as jumps, throws, runs, carries and others performed by the athletes.

Intensity refers to the quality of training such as speed of execution, time of performance and in between rest, rates of executions in terms of jumps, throws, runs, carries and others performed by the athletes.

- **Preparation Period** – the first and the longest period of training program. The athlete performed different activities from general to specific training. All round general fitness through gradually increasing the volume of load are being develop in this phase. The volume of load should be increased in such a way as a stairs where there is rest to have time for recovery and overcompensation.
- **Competition Period** – the volume of training for overall fitness is gradually decreased and intensity for training increase in relation to the characteristics of competitions. The training loads should be heavier to keep the athlete's fitness developing and lighter to keep the athlete's energy and enthusiastic in high level for competition. The athlete will develop the athletic shape that will show up in the last part of the competition period where there are ready for the big event – the competition proper.

- **Transition Period** – comes in the end of a season sometime refer to as the “active rest”. The main objective of this period is to have athletes to recover from the physical exhaustion received from previous competition and have the opportunity to recover mentally and physically from the two previous period of training. Light activities are being given in this period to keep the condition of athlete to its high level and be ready for the next cycle of training.

11. Planning the Training Session

- **Warm – Up** – done gradually increasing the load that involves all muscles to move in preparation for the main activities.
- **Skill Units** – starts from known unit gradually progressing to unknown or new unit, where athlete should be given time to execute the skill in a competition like simulation.
- **Fitness Unit** – is the parts where physical conditionings are being develop for the athletes to perform the skill with efficiency and accuracy.
- **Cool Down** – gradually lower the body temperature and heart rate. Opportunity to evaluate the completed unit.

VI. Skill Teaching – Helping athletes to acquire knowledge, physical skills and attitudes.

1. Techniques and Skills

- **Open and Closed Environment**

Open environment is the situation where athlete needs to respond to outside factors during competition such as reacting to his opponents and to come up with strategies.

Closed environment is the situations where athlete performance is stable and predictable in executing skill

- **Simple and Complex Skills**

Simple skill – where an individual athlete can perform with little practice.

Complex skill – where an individual athlete find more difficult to practice and needs longer time to acquire.

- **Skill Learning** – involves the nervous system, the brain and memory. In practicing a skill the memory of the previous attempts is the basis for performing the same action again. Precise memory of the action is formed with the continuous practice of a particular skill which is being recalled for used as the need arises.

2. **Stage of Learning**

- **Beginning Stage of Learning** – the thinking stage – working out what to do
- **The Intermediate Stage of Learning** – the learning stage – trying out ways to do it
- **The Advance Stage of Learning** – the skilled stage – performing the skill

3. **Methods of Teaching Simple Skills**

- **The Imitation Method** – simple imitation is time and again the best way for athletes to learn. The athlete is required to concentrate on what to be copied or imitated
- **The Demonstration / Explanation / Practice / Correction Method** – this method should follow the different steps:
 1. Demonstration with explanation
 2. Allow time to practice. Observe carefully, look for errors and corrections
 3. Provide information even as practice continues, if you must stop practice and prove correct action and if needed make suggestion to correct errors.
 4. Allow additional practice and put right more point, if needed

4. **Methods of Teaching Complex Skills**

- **Shaping a Complex Skill** – Making the whole action simpler
- **Chaining a Complex Skill** – Breaking a Skill into Simpler parts
- **Shaping vs. Chaining**

5. **Planning a Skill Unit**

- Plan an explanation and demonstration
- Plan how the athletes will practice the skill
- Provide feedback during practice
- Use effective communication skills

6. **Feedback**

- Intrinsic Feedback
- Augmented Feedback

7. **Effective Verbal Feedback**

- Specific not general
- Constructive not destructive
- Sooner not later
- Checked for clarity not left misunderstood
- Directed at behavior which is changeable?
- Corrects one fault at a time

VII. Sports Psychology – Factors that influence performance and how these factors may be controlled by utilizing mental aptitude

1. **Mental Skills** – Psychological preparation is as important as physical conditioning
2. **Personality** – People will interpret the same piece of information as physical conditioning
3. **Motivation** – how much an individual wants to achieve a goal and to understand motivation we need to know what goals an individual has.

4. Goal Setting

- Knowing What Your Athletes Want to Achieve
- Acceptable Goals
- Difficulty of Goals
- Specific Goals for Measuring Success
- Recording Goals

5. Emotional Control – Learning how to control anxiety

- Worry
- Psychological Arousal

6. Communication – two way process of exchanging information between the athlete and coach, and assists motivation, goal setting and all skill learning.**7. Developing Effective Communication Skills**

- Gaining the Athlete's Attention
- Learning to Use Your Voice
- Developing Non – Verbal Skills
- Developing Listening Skills

VIII. Nutrition – All the food a person eats and drinks.**1. Calories****2. The Energy Balance****3. Nutrients**

- Proteins – growth and repair foods
- Carbohydrates – energy food
- Fat – slow energy food
- Vitamins – booster food
- Minerals – support food

- Water – hydration of the bodies
- Fiber – laxatives

4. The Nutrient Balance – a person must take in the entire nutrients that require being healthy.**5. The Balance Diet** – is one that maintains an individual's nutrient balance**6. The Digestive System**

- Changing food to fuel
- Pre – competition Nutrition – eating to win

7. Analysis of Local Diet**IX. Injuries and First Aid** – Being aware of sports events and training or competition situation includes an element of hazard or risk.**1. Prevention of Injury****2. Prevention through skill****3. Prevention through Fitness**

- Strength
- Endurance
- Flexibility

4. Prevention through Nutrition**5. Prevention through Environment**

- To stretch the muscle and tendons, particularly those that are going to be used.
- To heat the body particularly the deep parts like the muscle and joints
- To prepare athletes for what is to follow by stimulating them mentally and physically.

6. Prevention through Treatment

- Equipment
- Surface
- Personal Clothing

7. Stages of Injuries

- The Acute Stage (0 – 24 hours)
- Middle Stage (24 – 48 hours)
- Final Stage (48 hours +)

8. Care of Soft Tissue Injuries

- R – Rest
- I – Ice
- C – Compress
- E – Elevation

9. Soft Tissues Injuries

- Mild
- Moderate
- Severe

10. Injuries to the Ankle

- Mild
- Moderate
- Severe

11. Rehabilitation of Sports Injuries

- Full flexibility, 100% range of motion
- Full strength return in the injured part
- Absence of pain
- Psychological readiness, absence of fear

12. Activity Guide for Injured Athletes

- Water Training

- Cycling
- Weight Training
- Recreational Walking
- Stretching and Relaxation

SPORTS OFFICIATING**I. NATURE OF SPORTS OFFICIATING****A. Definition of Sports Officiating**

That phase of competitive sports management, which deal directly with the proper conduct of the game.

New officials generally desire to officiate the sport that they played at the high school or collegiate level. There are many new officials; however, they pursue a sport that they love to watch. The game is something that is played by athletes; officials are assigned to “work” the games.

- B. Primary Function of Sports Officiating Officials:** To cause the game to progress with as little interference as possible.

Officiating is very addictive; once you get started, you can't get enough of it. It is important that you begin by working no more than two sports, as this will allow you to focus and learn the rules and the ins-and-outs of the officiating world.

C. Types of Officiating

1. **Decision on every action:** in this type of officiating a decision be made on every single action that keeps place. Ex. Tennis

2. **Discriminating Judgment:** decision depend upon the effort created by the players and the rule that permit the official to exercise discretion. Ex. Basketball

D. Kinds of Game Officials:

1. Field or court officials" Those who position or stay in the court of field of play. They may either be stationary (Ex. Volleyball and Badminton) or moving (basketball and Soccer).
2. Table Officials

E. Knowledge of the Rules

The rules of the game provide direction of play. Insure the neither team is given an unfair advantage. The intent of the rules should be foremost in the philosophy of all good officials. Knowledge of the rules, maintaining this knowledge and the proper application of this knowledge to the game situation are absolutely essential to good officiating. With good training and positive mental attitude, you can learn how to apply the rules and get into position to make the calls.

II. FOUNDATION OF SPORTS OFFICIATING

A. General Requirements

1. **Ability:** the natural talent for the job. This should be discovered and exploited to the fullest. If you played the game of basketball, for example, you have developed a feel for the game, and this will help you understand the advantage/disadvantage aspect of the game.
2. **Preparation:** The action or process of getting something ready for some duty. One of the most important aspects of sports officiating is

appearance. Like in your day-to-day business, officials are judged on how they look. The expression, "you never get a second chance to make a good first impression," applies specially to sports officiating. Your officiating clothes must be neat and pressed, and shoes must be polished. Also, you are judged on how you dressed for the game.

3. **Experience:** the amount of time work is being done and the skill or knowledge gained by actually doing. Excellent rules knowledge comes not only from studying them. But also from on the job training. There is no substitute for getting on the court or field and applying the rules to game situations.

B. Qualities of an Official

1. Essential Qualities

a.) **The potential of Presence:** "Be felt not heard, as much as possible." Through the influence of the presence, he causes players to avoid rule violations. His presence felt but he himself is not noticed. Mechanics refers to the positioning of the officials when working a game. You must be knowledgeable of your area of responsibility. Many calls are missed each year because an official was out of position. This is a big no-no in officiating.

- b.) **Official-Player Rapport:** "Win friends, but don't violate principles" a personal relationship that breeds friendliness and trust and not antagonism is essential to successful game control. The art of being one's self and being able to sense the correct approach to each situation is the secret of establishing the correct rapport.
- c.) **Good Public Relations:** "Be pleasant, but firm and fearless." Remember that the sport was created for the players and not for the official. Dominate the game but be noticed as little as possible.

2. Requisite Qualities

- a.) **Knowledge of the rules:** Know the rules thoroughly and the intentions or spirit behind them.
- b.) **First-Hand Experience in the Game:** Having played the game is a great factor. Participation provides the official with a better understanding of the fundamentals and strategy and the practical application of the rules in actual game situations. This will be enabling him to anticipate and follow the participants and the game situations more closely.
- c.) **Physical Fitness** – the quality of officiating performance can be limited by the physical condition of the official. Good conditioning is necessary throughout the game to enable the official to:
 - 1) Be where he should be
 - 2) Maintain his alertness and good judgment
 - 3) Hold up his end of the teamwork with his fellow official

3. Personal Qualities

- a.) **Good Judgment** – the ability to see a situation and to make the correct response to that situation. Good judgment is made up of three parts:
 - 1) Perception: the ability to look at a situation and ascertain what is truly taking place.
 - 2) Position
 - 3) Experience
- b.) **Concentration** – Defined as being aware of only the present. It means having one's complete conscious mental attention on only an individual's present performance, to the complete exclusion of all other in-

ternal and/or external stimuli. Concentration is a very fundamental and important mental skill, which must be learned by all aspiring officials.

- c.) **Good Mechanics** – mechanics of officiating is a system designed as a practical working method to facilitate the tasks of the officials on the court. It is intended to help the referees concentrate on obtaining the best possible position and to follow the progress of the game enabling judgmental decision to be taken. Its primary objective is to achieve proper control. The two primary areas of mechanics are “signaling” and “positioning”. Where more than one officials involved, “teamwork” becomes a third category, and additional signaling and positioning responsibilities are then necessary. The mechanics of signaling, positioning and teamwork are all of essential importance to assure professional performance. Signals may be executed by circumstance, sharp, unhesitating and unhurried signals are necessary both to communicate decision and to build the confidence of participants and observers in your abilities. Correct positioning is necessary to permit you to see (rather than guess) what you are hired to see. Teamwork procedures are necessary to provide balance coverage of all conceivable actions to minimize or eliminate disagreement between/among the officials. When proper mechanics are observed precisely the game progresses without confusion or unnecessary delay.
- d.) **Officiating is about teamwork.** You must be able to get along with the men and women that work in your crews. If your partners dislike you, it is going to be very tough (perhaps impossible) for you to be a successful official. Many retiring officials state that the camaraderie with fellow officials is what they will miss the most. After joining the officiating community, you will notice that fellow officials will be some of your best friends, and remain so the rest of your life. If you are not a likeable person; that is, if you are arrogant, conceited or act like a know-it-all, it is very doubtful that you will have any semblance of suc-

cess as an official. Officiating games is a very humbling experience, where you will make many mistakes. If you are a person who has a hard time accepting constructive criticism, it is better to stay away from joining the officiating ranks.

The first two obligations of new officials are to:

- 1) Learn and understand the playing rules,
 - 2) Develop the correct habits involved in officiating mechanics.
- e.) **Hustle** – Means to move and act with resolute energy. It includes mental readiness, physical movement and a genuine interest in the game. Game must be taken to avoid two extremes:
- 1) Pointless running to give the impression of the hustle;
 - 2) The ‘rocking chair’ official who calls the entire game from the same spot.
- f.) **Cooperation** – The ability to team with fellow officials is absolutely essential to a well – handed game. The officials should gauge their decisions so that they are as uniform as possible. Each must have faith in the other, and harmony must exist between them. Any tendency for one official to attempt to dominate the game may cause a poorly administered game. Each should welcome the support to the play. Each should be ready realize that he is not always in an advantageous position to see all the action, even though he is close to the play. Each should be ready to cover play for the other when one is momentarily caught out of position.
- g.) **Consistency** – Applying the correct rule interpretation and administering the rules to each situation a distinct separate part of the game. No two officials possess the same judgment; although individual differences do exist, these effects are minimized by the use of correct rule interpretation. The rule interpretation applied uniformly by all officials’

lead to the high level of consistent officiating. Conscientious, intelligent effort coupled with experience will develop consistency for most officials.

- h.) **Decisiveness** – The decisive official converts a controversial or judgmental decision into accepted decision through decisiveness. A good official will “sell” his call to the game participants. This selling process starts with a firm blast on the whistle. The second is the hand signal. Finally, the proper hand signal must be given.
- i.) **Confidence** – Confidence and decisiveness are closely related. Confidence deals more with the attitude of the official and impression he makes, while decisiveness is concentrated on the mechanics of officiating. Anxiety and self – doubt have no place in the mind of the good officials. Confidence is gained through experience and knowledge of the game. The confident official is aware of all the possible situations that can arise and he is prepared with the correct response. Confidence is reflected in the attitude, voice projection, and game control. Decisive action that is not hasty but has no element of hesitation is highly desirable. It leaves no doubt in the mind of others. It portrays possessiveness that wins acceptance. A resonant strong voice is a great asset to an official. By means of a clear strong voice, the official is able to convey to all the exact decisions he has made. Baritone quality is probably best; a high pitched voice is the poorest. The use of the voice supplemented by pantomime for clarity in signaling decisions is desirable. The whistle blown sharply has the effect of saying “Attention Please” and alerting everyone to the field that an important decision is to be announced.
- j.) **Poise/ Calmness** – Poise is complete self – control and is not always the easiest thing to maintain. However, it is essential to the good official. Amid the chaos, the official must stand as the steady force.

Maintaining control requires a great deal of concentration on the part of the official.

- k.) **Courage** – The ability to give decision with a firm conviction. Courage is a personal quality, but it also largely based upon understanding and accepting officiating responsibilities. Competitive rules empower & obligate the official to make the indicate rulings to the best of his ability.

Two most unfavorable things that can be done are:

- 1) Avoid a decision where a decision is required.
- 2) To make a decision merely because it is demanded

- l.) **Objectivity** – Treating facts without distortion by personal feelings or prejudices. As human beings, various pressures can influence officials. But the official is not supposed to be influenced by external pressures. Most officials benefit from: consciously recognizing their own susceptibility to being influenced; and seriously attempting to improve their complete objectivity in each game. Otherwise, the temptations of a given moment in the competition can lead the normally well meaning individual to make a popular decision rather than a correct decision.

- m.) **Reaction Time** – the ability to respond to a given stimulus as quickly as possible. Assuming that judgment is correct, decisions, which are made quickly, have a great chance of being accepted without question. An official with fast reaction frequently can make the decision and simultaneously with the moment of the action (split-second decision). This qualification is a must, because one either has quick reaction time or one does not simply have it. The best method of gaining the confidence of players is to make decision at the time a player is going through his maneuver. Therefore, a “subtle influence” on the game is quickly and firmly established.

III. BASIC PHILOSOPHY

A. Essential Objectives

1. Each official should have a clear concept of his over-all responsibility when he reports for duty.
2. If all officials possessed the same conception, there would be uniformity in administration of all contests.
3. The key to excellent officiating is adherence to the advantage-disadvantage philosophy, or stated in another manner “realistic officiating”.
4. The essence of Mr. Oswald Tower’s philosophy: “It is the purpose of the rules to penalize a player who by reason of an illegal act has placed his opponent at a disadvantage.”
5. It represents a realistic approach to guide a judgment of officials in making decisions on all situations where the effect upon the play is the key factor on determining whether or not a rule violation has occurred.

B. General Principle of Officiating

The primary function and aim of officiating can be better obtained by adhering to the following basic principles:

1. Uniformity in the interpretation
2. Close collaboration between coaches and officials
3. Keep close to the play
4. Don’t imagine or suspect – see it happen
5. Decide or rule on acts completed
Call what you see anywhere

PART II – ANALYZING TEST ITEMS

Test I. Multiple Choice: Write the letter of your answer.

1. Little or no trust in the athlete
 - a. Authoritarian
 - b. Cooperative
 - c. Casual
2. Athlete with a flexible training structure
 - a. Cooperative
 - b. Authoritarian
 - c. Casual
3. Athletes make all the decisions
 - a. Casual
 - b. Authoritarian
 - c. Cooperative
4. Support the body like the frame work of a building
 - a. Skeleton
 - b. Muscles
 - c. Bones
5. Joins muscle to bone
 - a. Muscles
 - b. Tendons
 - c. Skeleton
6. Approximately 200 in human body
 - a. Tendons
 - b. Bones
 - c. Muscles
7. Can only pull not push
 - a. Bones
 - b. Muscles
 - c. Tendons
8. Joins bone to bone
 - a. Cells
 - b. Nerves
 - c. Ligaments
9. Unit of living material that is the base building block of life
 - a. Ligaments
 - b. Cells
 - c. Nerves

10. Carry information around the body by electrical signals
 - a. Nerves
 - b. Ligaments
 - c. Cells
11. Uses oxygen and produces easily disposed waste products
 - a. Aerobic lactic Energy System
 - b. Anaerobic lactic Energy System
 - c. Anaerobic alactic Energy System
12. Intense activity for less than 10 seconds
 - a. Aerobic lactic Energy System
 - b. Anaerobic lactic Energy System
 - c. Anaerobic alactic Energy System
13. The energy system most used by the 400 meter racer
 - a. Aerobic lactic Energy System
 - b. Anaerobic lactic Energy System
 - c. Anaerobic alactic Energy System
14. Begins when adolescence finishes
 - a. Childhood
 - b. Adolescence
 - c. Adulthood
15. From birth to two years of age
 - a. Childhood
 - b. Adolescence
 - c. Infancy
16. Period for learning basic movements
 - a. Childhood
 - b. Adolescence
 - c. Infancy
17. Stages of sexual development
 - a. Childhood
 - b. Adulthood
 - c. Puberty
18. Period for developing athletic event specific skills
 - a. The skill stage
 - b. The learning stage
 - c. The thinking stage
19. Working out what to do
 - a. The skill stage
 - b. The learning stage
 - c. The thinking stage

20. Performing the skill
a. The skill stage b. The learning stage c. The thinking stage
21. Trying out ways of doing it
a. The skill stage b. The learning stage c. The thinking stage
22. Fitness reduces when training stops
a. Law of Specificity b. Law of Overload c. Law of Reversibility
23. Specific adaptation to applied training loads
a. Law of Specificity b. Law of Overload c. Law of Reversibility
24. Results in overcompensation
a. Law of Specificity b. Law of Overload c. Law of Reversibility
25. Which of the following is an essential quality of an official?
a. Knowledge of the game c. Official – player rapport
b. Physical fitness d. First hand experience

PART III – ENHANCING TEST TAKING SKILLS

1. The ability to exert force?
a. Flexibility c. Strength
b. Coordination d. Endurance
2. Capacity to travel or move very quickly
a. Flexibility c. Speed
b. Coordination d. Endurance
3. Perform and learn skills well
a. Flexibility c. Strength
b. Coordination d. Endurance
4. Resistance to fatigue
a. Flexibility c. Strength
b. Power d. Endurance
5. Gradually reduces with age
a. Flexibility c. Speed
b. Coordination d. Endurance
6. Volume of training is gradually reduces and intensity increased
a. Competition Period c. Preparation Period
b. Transition Period
7. Volume of training gradually increases
a. Competition Period c. Preparation Period
b. Transition Period

8. Motor programs develops most
 - a. Intermediate stage
 - b. beginning stage
 - c. Advanced stage
9. Athletes need to practice skill under different and difficult conditions
 - a. Intermediate stage
 - b. beginning stage
 - c. Advanced stage
10. Completed when the athlete can perform a rough form of the skill
 - a. Intermediate stage
 - b. beginning stage
 - c. Advanced stage
11. Body repair and growth
 - a. Protein
 - b. Vitamins
 - c. Minerals
 - d. Carbohydrate
12. Essential fuel control rate of chemical reactions
 - a. Protein
 - b. Vitamins
 - c. Minerals
 - d. Carbohydrate
13. Adds non-digestible bulk to food
 - a. Protein
 - b. Fiber
 - c. Minerals
 - d. Carbohydrate
14. 50% - 70% of the body
 - a. Water
 - b. Vitamins
 - c. Minerals
 - d. Carbohydrate
15. Slowly digested fuel
 - a. Fat
 - b. Vitamins
 - c. Minerals
 - d. Carbohydrate
16. Which of the following is not a personal quality of an official?
 - a. Body mechanics
 - b. Physical Fitness
 - c. Hustle
 - d. Concentration
17. Which of the following statements referred to as essential quality of an official?
 - a. Knowledge of the game
 - b. Physical fitness
 - c. Official – player rapport
 - d. First hand experience
18. Which of the following is not the primary function and aim of officiating?
 - a. Uniformity in interpretation
 - b. Decide on act completed
 - c. Call what you see
 - d. The potential of presence
19. Who is responsible for establishing program, funding and evaluation of the program?
 - a. Director
 - b. Council
 - c. Student Leader
 - d. Volunteers
20. Which of the following statement is a function and aim of officiating?
 - a. Difference in interpretation
 - b. Decide on act not completed
 - c. Call what you see
 - d. The potential of presence

Individual, Dual and Combative Sports

Prepared by:
Prof. Julio Victor B. Santarin

Competencies:

1. Analyze playing skills and performance in actual play/ game

PART I - CONTENT UPDATE

ATHLETICS

Athletics, commonly known as Track and Field, is a collection of sports events that involve running, throwing and jumping. The name “athletics” is derived from the Greek word “athlos” meaning “contest”.

RUNNING: events conducted on a track (generally 400 meter, except indoors):

- **Sprints:** events up to and including the 400 meters. Common lengths include:
 1. 60 meters (indoors only)
 2. 100 meters
 3. 200 meters
 4. 400 meters (quarter mile)
- **Middle Distance Events:**
events from 600 meters to the mile. Common lengths include:
 1. 600 meters (indoor)
 2. 800 meters (half mile)
 3. 1,000 meters (indoor)
 4. 1,500 meters (metric mile)
- **Long Distance Events:**
events over, and including, the 3000 meters (3 k). Common lengths include:
 1. 3,000 meter run
 2. 3,000 meter steeplechase
 3. 5,000 meter run
 4. 10,000 meter run
- **Hurdles:** events that require the runner to jump over evenly spaced barriers

during the race. Common lengths include

1. 60 meter hurdles (indoor)
2. 100 m hurdles (women)
3. 110 m hurdles (men)
4. 400 m hurdles
5. 3000 m Steeplechase

- **Relays:** races in which four athletes participate as a team, passing a baton in between. Common lengths include:
1. 4 x 100 meter relay Non-visual pass
 2. 4 x 400 meter relay Visual pass

➤ **Road Races:**

Common lengths are:

1. 5000 meters (5 km)
2. 10,000 meters (10 km)
3. Half marathon (21.0975 km)
4. Marathon (42.195 km). The marathon is the only common road-racing distance run in major international athletics championships, such as the Olympics.

Field Events

➤ **Throwing Events**

1. Javelin
2. Shot Put
3. Hammer Throw The “hammer” used for the hammer throw is different, whether the event is indoors (often a large ball, resembling a medicine ball, with a handle attached) or outdoors (basically a shot with a handle attached)
4. Discus

➤ **Jumping Events**

1. High Jump
2. Pole Vault
3. Triple Jump
4. Long Jump

➤ **Heptathlon:** the Heptathlon includes the following seven events:

Outdoors (usually only women):

- | | |
|------------------------|------------------|
| 1st day | 2nd day |
| 1. 100 meter L hurdles | 5. Long Jump |
| 2. High Jump | 6. Javelin Throw |
| 3. Shot Put | 7. 800 meters |
| 4. 200 meters | |

➤ **Decathlon:** the Decathlon includes the following ten events:

- | | |
|---------------|------------------------|
| 1st day | 2nd day |
| 1. 100 meters | 6. 110 meter H hurdles |
| 2. Long Jump | 7. Discus |
| 3. Shot Put | 8. Pole Vault |
| 4. High Jump | 9. Javelin |
| 5. 400 meters | 10. 1500 meters |

➤ **Race walking:** Common lengths are:

1. 10 km
2. 20 km
3. 50 km

Rules

Track events

1. Starting
 - The start of a race is marked by a white line 5cm wide. In all races that

are not run in lanes the start line must be curved, so that all the athletes start the same distance from the finish

- Starting blocks must be used for all races up to and including 400 m (including the first leg of the 4 x 200 m and 4 x 400 m) and may not be used for any other race. No part of the starting block may overlap the start line or extend into another lane.
- All races must be started by the report of the starter's gun or approved starting apparatus fired upwards after he or she has ascertained that athletes are steady and in the correct starting position
- An athlete may not touch either the start line or the ground in front of it with his hands or his feet when on his marks
- At most international competitions the commands of the starter in his own language, in English or in French must, in races up to and including 400 m, be "on your marks" and "set". When all athletes are "set", the gun must be fired, or an approved starting apparatus must be activated
- False start: An athlete, after assuming a final set position, may not commence his starting motion until after receiving the report of the gun, or approved starting apparatus. If, in the judgment of the starter or recalls, he does so any earlier, it is considered a false start.
- It is deemed a false start if, in the judgment of the starter an athlete fails to comply with the commands "on your marks" or "set" as appropriate after a reasonable time; or an athlete after the command "on your marks" disturbs other athletes in the race through sound or otherwise.
- Any athlete making a false start must be warned.

Running the race

- In all races run in lanes, each athlete must keep within his allocated lane from start to finish. This also applies to any portion of a race run in lanes.
- Any athlete who jostles or obstructs another athlete, in a way that impedes his progress, should be disqualified.

The finish

- The athletes must be placed in the order in which any part of their bodies (i.e. torso, as distinguished from the head, neck, arms, legs, hands or feet) reaches the vertical plane of the nearer edge of the finish line.

High Jump

The Competition

1. An athlete shall take off from one foot.
2. An athlete fails if:
 - (a) After the jump, the bar does not remain on the supports because of the action of the athlete whilst jumping; or
 - (b) He touches the ground including the landing area beyond the vertical plane through the nearer edge of the crossbar, either between or outside the uprights with any part of his body, without first clearing the bar.

Pole Vault

The Competition

1. An athlete fails if:
 - (a) after the vault, the bar does not remain on the pegs because of the action of an athlete whilst vaulting

- (b) he touches the ground, including the landing area beyond the vertical plane through the back end of the box with any part of his body or with the pole, without first clearing the bar after leaving the ground he places his lower hand above the upper one or moves the upper hand higher on the pole.
- (d) during the vault an athlete steadies or replaces the bar with his hand/s. All jumps shall be measured from the nearest break in the landing area made by any part of the body to the take-off line, or take-off line extended (see Rule 185.1(f)). The measurement shall be taken perpendicular to the take-off line or its extension.

Triple Jump

The Rules for the Long Jump apply to the Triple Jump with the following additions:

The Competition

1. The Triple Jump shall consist of a hop, a step and a jump in that order.
2. The hop shall be made so that an athlete lands first on the same foot as that from which he has taken off; in the step he shall land on the other foot, from which, subsequently, the jump is performed.

C. THROWING EVENTS

➤ Personal Safeguards

- (a) An athlete shall not use any device of any kind -e.g. the taping of two or more fingers together or using weights attached to the body -which in any way provides assistance when making a trial. An athlete may use tape on the hand when needed to cover an open cut or wound. An athlete in the Hammer Throw may tape individual fingers.
- (b) An athlete shall use gloves in the Hammer Throw only.

- (c) In order to obtain a better grip, an athlete may use a suitable substance on his hands only. In addition, hammer throwers may use such substances on their gloves, and shot putters may use such substances on their neck.
- (d) In order to protect the spine from injury, an athlete may wear a belt of leather or other suitable material.

Trials

In the Shot Put, Discus Throw and Hammer Throw, implements shall be thrown from a circle and in the Javelin Throw from a runway. In the case of trials made from a circle, an athlete shall commence his trial from a stationary position inside the circle. An athlete is allowed to touch the inside of the rim. In the Shot Put he is also allowed to touch the inside of the stop board described in Rule 188.2.

It shall be a failure if an athlete in the course of a trial:

- (a) Improperly releases the shot or the javelin,
 - (b) after he has stepped into the circle and begun to make a throw, touches with any part of his body the top of the rim or the ground outside the circle,
 - (c) in the Shot Put, touches with any part of his body the top of the stop board,
 - (d) in the Javelin Throw, touches with any part of his body the lines which mark the runway or the ground outside. It shall be a failure if the shot, the discus, the hammerhead or the tip of the javelin in contacting the ground when it first lands touches the sector line or the ground outside the sector line.
17. An athlete shall not leave the circle or runway until the implement has touched the ground
 - (b) In the case of the Javelin Throw, when an athlete leaves the runway, the first contact with the parallel lines or the ground outside the runway shall be completely behind the white line of the arc at right angles to the parallel lines.

18. After each throw, implements shall be carried back to the area next to the circle or runway and never thrown back.

Measurements

In all throwing events, distances shall be recorded to the nearest 0.01m below the distance measured if the distance measured is not a whole centimeter.

20. The measurement of each throw shall be made immediately after the trial:
- From the nearest mark made by the fall of the shot, discus and hammer head, to the inside of the circumference of the circle
Along a line to the centre of the circle;
 - In Javelin Throw, from where the tip of the javelin first struck the ground to inside edge of the arc, along a line to the
Centre of the circle of which the arc is part.

Markers

21. A distinctive flag or marker may be provided to mark the best throw of each athlete, in which case it shall be placed along, and outside, the sector lines. A distinctive flag or marker may also be provided to mark the existing World Record and, when appropriate, the existing Area, National or Meeting Record.

Shot Put

The Competition

- The shot shall be put from the shoulder with one hand only. At the time an athlete takes a stance in the circle to commence a put, the shot shall touch or be in close proximity to the neck or the chin and the hand shall not be dropped below this position during the action of putting. The shot shall not be taken behind the line of the shoulders.

Hammer Throw

The Competition

- An athlete, in his starting position prior to the preliminary swings or turns, is allowed to put the head of the hammer on the ground inside or outside the circle.
- It shall not be considered a failure if the head of the hammer touches the ground inside or outside the circle, or the top of the rim.
- The athlete may stop and begin the throw again, provided no other Rule has been breached.
- If the hammer breaks during a throw or while in the air, it shall not count as a failure.

Javelin Throw

The Competition

- The javelin shall be held at the grip. It shall be thrown over the shoulder or upper part of the throwing arm and shall not be slung or hurled.
 - A throw shall be valid only if the tip of the metal head strikes the ground before any other part of the javelin.
 - Until the javelin has been thrown, an athlete shall not at any time turn completely around, so that his back is towards the throwing arc.
- If the javelin breaks during a throw or while in the air, it shall not count as a failure.

Combined Events Competitions

The Men's Decathlon consists of ten events which shall be held on two consecutive days in the following order:

First day: 100m; Long Jump; Shot Put; High Jump; 400m.

Second day: 110m Hurdles; Discus Throw; Pole Vault; Javelin Throw; 1500m.

WOMEN Heptathlon

The Heptathlon consists of seven events, which shall be held on two consecutive days in the following order:

First day: 100m Hurdles; High Jump; Shot Put; 200m.

Second day: Long Jump; Javelin Throw; 800m.

The Women's Decathlon consists of ten events which shall be held on two consecutive days in the following order:

First day: 100m; Discus Throw; Pole Vault; Javelin Throw; 400m.

Second day: 100m Hurdles; Long Jump; Shot Put; High Jump; 1500m.

General

7. At the discretion of the Combined Events Referee, there shall, whenever possible, be an interval of at least 30 minutes between events, for any individual athlete. If possible, the time between the last event and the start of the first event on the succeeding day should be at least 10 hours.
9. The Rules for each event constituting the competition will apply with the following exceptions:
 - (a) In the Long Jump and each of the throwing events, each athlete shall be allowed three trials only.
 - (b) In case Fully Automatic Timing is not available, each athlete's time shall be taken by three Timekeepers independently.
 - (c) In the track events, an athlete shall be disqualified in any event in which he has made two false starts.

Officials of the Competition

The Organising Committee of a competition shall appoint all officials, subject to the Rules of the Member in whose country the competition is held and, in the case

of competitions under Rules 1.1(a),(b),(c) and (f), subject to the Rules and procedures of the appropriate international organisation.

The following list comprises the officials considered necessary for major International Competitions. The Organizing Committee may, however, vary this according to local circumstances.

MANAGEMENT OFFICIALS

- One Competition Director
- One Meeting Manager
- One Technical Manager
- One Event Presentation Manager

COMPETITION OFFICIALS

- One Referee for the Call Room
- One (or more) Referee for Track Events
- One (or more) Referee for Field Events
- One (or more) Referee for Combined Events
- One (or more) Referee for events outside the Stadium
- One Chief Judge and an adequate number of Judges for Track Events
- One Chief Judge and an adequate number of Judges for each Field Event
- One Chief Judge and five Judges for each Track Race Walking Event
- One Chief Judge and eight Judges for each Road Race Walking Event
- Other Race Walking Competition officials, as necessary, including Recorders, Posting Board operators, etc.
- One Chief Umpire and an adequate number of Umpires
- One Chief Timekeeper and an adequate number of Timekeepers
- One Start Coordinator and an adequate number of Starters and Recalls
- One (or more) Starter's Assistant
- One Chief and an adequate number of Lap Scorers
- One Competition Secretary and an adequate number of assistants

- One Chief and an adequate number of Marshals
- One (or more) Wind Gauge Operator
- One Chief Photo Finish Judge and an adequate number of Assistant Photo Finish Judges
- One (or more) Measurement Judge (Electronics)
- One Chief and an adequate number of Call Room Judges

ADDITIONAL OFFICIALS

- One (or more) Announcer
- One (or more) Statistician
- One Advertising Commissioner
- One Official Surveyor
- One (or more) Doctor
- Stewards for Athletes, Officials and Press

FACILITIES AND EQUIPMENT

Badminton

Badminton is a racquet sport played by either two opposing players (singles) or two opposing pairs (doubles), who take positions on opposite halves of a court that is divided by a net. Players score points by striking a shuttlecock with their racquet so that it passes over the net and lands in their opponents' court. A rally ends once the shuttlecock has struck the ground, and the shuttlecock may only be struck once by each side before it passes over the net.

History and development

Badminton was called *"Poona"* in India during the 18th century, and British Army officers assigned there took an energetic Indian type back to England in the 1860s, where it was introduced as an upper class amusement. Isaac Spratt published a booklet, *"Badminton Battledore - a new game"* in 1860, but unfortunately no copy has survived.

The International Badminton Federation (IBF) (now known as Badminton World Federation) was established in 1934 with Canada, Denmark, England, France, the Netherlands, Ireland, New Zealand, Scotland, and Wales as its founding members. India joined as an affiliate in 1936. The BWF now governs international badminton and develops the sport globally.

Although originated in England, international badminton has usually dominated by Asian countries, plus Denmark from Europe.

China, Indonesia, South Korea and Malaysia are among the nations that have consistently produced world-class players in the past few decades and dominated competitions on the international level, with China domination in recent years.

Badminton strokes

Badminton offers a wide variety of basic strokes, and players require a high

level of skill to perform all of them effectively. All strokes can be played either forehand or backhand.

A player's forehand side is the same side as his playing hand: for a right-handed player, the forehand side is his right side and the backhand side is his left side. Forehand strokes are hit with the front of the hand leading (like hitting with the palm), whereas backhand strokes are hit with the back of the hand leading (like hitting with the knuckles). Players frequently play certain strokes on the forehand side with a backhand hitting action, and vice-versa

Service

The service presents its own array of stroke choices.

The serve is restricted by the Laws so that it must be hit upwards.

The server can choose a low serve into the forecourt (like a push), or a lift to the back of the service court, or a flat drive serve.

Lifted serves may be either high serves, where the shuttlecock is lifted so high that it falls almost vertically at the back of the court.

Strategy

To win in badminton, players need to employ a wide variety of strokes in the right situations.

These range from powerful jumping smashes to delicate tumbling net returns. Often rallies finish with a smash, but setting up the smash requires subtler strokes. For example, a net shot can force the opponent to lift the shuttlecock, which gives an opportunity to smash. If the net shot is tight and tumbling, then the opponent's lift will not reach the back of the court, which makes the subsequent smash much harder to return. Deception is also important. Expert players make the preparation for many different strokes look identical, and use slicing to deceive their opponents about the

speed or direction of the stroke. If an opponent tries to anticipate the stroke, he may move in the wrong direction and may be unable to change his body momentum in time to reach the shuttlecock.

Singles

The singles court is narrower than the doubles court, but the same length, with the exception that a serve in the single can reach the end of the court while a serve in the doubles could not. Since one person needs to cover the entire court, singles tactics are based on forcing the opponent to move as much as possible; this means that singles strokes are normally directed to the corners of the court. Players exploit the length of the court by combining lifts and clears with drop shots and net shots. Smashing is less prominent in singles than in doubles because players are rarely in the ideal position to execute a smash, and smashing often leaves the smasher vulnerable if the smash is returned.

Doubles

Both pairs will try to gain and maintain the attack, smashing downwards when possible.

Whenever possible, a pair will adopt an ideal attacking formation with one player hitting down from the rear court, and his partner in the mid court intercepting all smash returns except the lift. If the rear court attacker plays a drop shot, his partner will move into the forecourt to threaten the net reply. If a pair cannot hit downwards, they will use flat strokes in an attempt to gain the attack. If a pair is forced to lift or clear the shuttlecock, then they must defend: they will adopt a side-by-side position in the rear mid court, to cover the full width of their court against the opponents' smashes. Both pairs will try to gain and maintain the attack, smashing downwards when possible. Whenever possible, a pair will adopt an ideal attacking formation with one

player hitting down from the rear court, and his partner in the mid court intercepting all smash returns except the lift. If a pair is forced to lift or clear the shuttlecock, then they must defend: they will adopt a side-by-side position in the rear mid court, to cover the full width of their court against the opponents' smashes. Both pairs will try to gain and maintain the attack, smashing downwards when possible. Whenever possible, a pair will adopt an ideal attacking formation with one player hitting down from the rear court, and his partner in the mid court intercepting all smash returns except the lift.

Mixed doubles

In mixed doubles, both pairs try to maintain an attacking formation with the woman at the front and the man at the back. This is because the male players are substantially stronger, and can therefore produce more powerful smashes. As a result, mixed doubles requires greater tactical awareness and subtler positional play. Clever opponents will try to reverse the ideal position, by forcing the woman towards the back or the man towards the front. In order to protect against this danger, mixed players must be careful and systematic in their shot selection

DEFINITIONS

Player: Any person playing Badminton.

Match: The basic contest in Badminton between opposing sides each of one or two players.

Singles: A match where there is one player on each of the opposing sides.

Doubles: A match where there are two players on each of the opposing sides

Serving side: The side having the right to serve.

Receiving side: The side opposing the serving side.

Rally: A sequence of one or more strokes starting with the service, until the shuttle ceases to be in play.

Stroke: A forward movement of the player's racket.

The Laws of Badminton

COURT AND COURT EQUIPMENT

The court shall be a rectangle marked out with lines 40 mm wide as shown in Diagram A. The lines marking out the court shall be easily distinguishable and preferably be colored white or yellow. All the lines shall form part of the area which they define.

POST

The posts shall be 1.55 meters in height from the surface of the court and shall remain vertical when the net is strained as provided in Law 1.10. The posts or its supports shall not extend into the court. The posts shall be placed on the doubles side lines as in Diagram A irrespective of whether singles or doubles is being played.

NET

The net shall be made of fine cord of dark color and even thickness with a mesh of not less than 15 mm and not more than 20 mm. The net shall be 760 mm in depth and at least 6.1 meters wide. The top of the net shall be edged with a 75 mm white tape doubled over a cord or cable running through the tape. This tape shall rest upon the cord or cable. The cord or cable shall be stretched firmly, flush with the top of the posts. The top of the net from the surface of the court shall be 1.524 meters at the centre of the court and 1.55 meters over the side lines for doubles. There shall be no gaps between the ends of the net and the posts. If necessary, the full depth of the net at the ends shall be tied to the posts

SHUTTLE

The shuttle shall be made of natural and / or synthetic materials. From whatever material the shuttle is made, the flight characteristics generally shall be

similar to those produced by a natural feathered shuttle with a cork base covered by a thin layer of leather. Feathered shuttle shall have 16 feathers fixed in the base. The feathers shall have a uniform length between 62 mm to 70 mm when measured from the tip to the top of the base. The tips of the feathers shall lie on a circle with a diameter from 58 mm to 68 mm. The feathers shall be fastened firmly with thread or other suitable material. The base shall be 25 mm to 28 mm in diameter and rounded on the bottom. The shuttle shall weigh from 4.74 to 5.50 grams. Non-Feathered Shuttle - The skirt, or simulation of feathers in synthetic materials, shall replace natural feathers. However, because of the difference in the specific gravity and other properties of synthetic materials in comparison with feathers, a variation of up to 10 per cent shall be acceptable. Subject to there being no variation in the general design, speed and flight of the shuttle, modifications in the above specifications may be made with the approval of the Member Association concerned, in places where atmospheric conditions due to either altitude or climate make the standard shuttle unsuitable.

RACKET

The racket shall be a frame not exceeding 680 mm in overall length and 230 mm in overall width consisting of the handle is the part of the racket intended to be gripped by a player. The stringed area is the part of the racket with which it is intended that a player hits the shuttle. The head bounds the stringed area. The shaft connects the handle to the head. The throat (if present) connects the shaft to the head shall be flat and consist of a pattern of crossed strings either alternately interlaced or bonded where they cross. The stringing pattern shall be generally uniform and, in particular, not less dense in the centre than in any other area; and shall not exceed 280 mm in overall length and 220 mm in overall width. However, the strings may extend into an area which otherwise would be the throat, provided that: the width of the extended stringed area does not exceed 35 mm; and the overall length of

the stringed area does not then exceed 330 mm. The racket: shall be free of attached objects and protrusions, other than those used solely and specifically to limit or prevent wear and tear, or vibration, or to distribute weight, or to secure the handle by cord to the player's hand, and which are reasonable in size and placement for such purposes; and shall be free of any device that makes it possible for a player to change materially the shape of the racket.

TOSS

Before play commences, a toss shall be conducted and the side winning the toss shall exercise the choice in either to serve or receive first; to start play at one end of the court or the other. The side losing the toss shall then exercise the remaining choice.

SCORING SYSTEM

A match shall consist of the best of three games, unless otherwise arranged. A game shall be won by the side which first scores 21 points, except if the score becomes 20-all, the side which gains a two point lead first, shall win that game and if the score becomes 29-all, the side scoring the 30th point shall win that game. The side winning a rally shall add a point to its score. A side shall win a rally, if the opposing side commits a "fault" or the shuttle ceases to be in play because it touches the surface of the court inside the opponent's court. The side winning a game shall serve first in the next game.

CHANGE OF ENDS

Players shall change ends: at the end of the first game; at the end of the second game, if there is to be a third game; and in the third game when a side first scores 11 points. If the ends are not changed it shall be done so as soon as the mistake is discovered and when the shuttle is not in play. The

existing score shall stand. If the ends are not changed it shall be done so as soon as the mistake is discovered and when the shuttle is not in play. The existing score shall stand

SERVICE

In a correct service: neither side shall cause undue delay to the delivery of the service once the server and the receiver are ready for the service. On completion of the backward movement of server's racket head, any delay in the start of the service shall be considered to be an undue delay; the server and the receiver shall stand within diagonally opposite service courts with out touching the boundary lines of these service courts; some part of both feet of the server and the receiver shall remain in contact with the surface of the court in a stationary position from the start of the service until the service is delivered; the server's racket shall initially hit the base of the shuttle; the whole shuttle shall be below the server's waist at the instant of being hit by the server's racket. The waist shall be considered to be an imaginary line round the body, level with the lowest part of the server's bottom rib; the shaft of the server's racket at the instant of hitting the shuttle shall be pointing in a downward direction; the movement of the server's racket shall continue forwards from the start of the service until the service is delivered; the flight of the shuttle shall be upwards from the server's racket to pass over the net so that, if not intercepted, it shall land in the receiver's service court (i.e. on or within the boundary lines); and in attempting to serve, the server shall not miss the shuttle. Once the players are ready for the service, the first forward movement of the server's racket head shall be the start of the service. Once started the service is delivered when the shuttle is hit by the server's racket or, in attempting to serve, the server misses the shuttle. The server shall not serve before the receiver is ready. However, the receiver shall be considered to have been ready if a return of the service is a temped. In doubles, during the delivery of service, the partners may take up any

positions within their respective courts, which do not unsight the opposing server or receiver.

SINGLES

Serving and receiving courts.

The players shall serve from, and receive in, their respective right service courts when the server has not scored or has scored an even number of points in that game. The players shall serve from, and receive in, their respective left service courts when the server has scored an odd number of points in that game. Order of play and position on court in a rally, the shuttle may be hit by the server and the receiver alternately, from any position on that player's side of the net, until the shuttle ceases to be in play.

Scoring and serving

If the server wins a rally the server shall score a point. The server shall then serve again from the alternate service court. If the receiver wins a rally, the receiver shall score a point. The receiver shall then become the new server.

DOUBLES

Serving and receiving courts

A player of the serving side shall serve from the right service court when the serving side has not scored or has scored an even number of points in that game. A player of the serving side shall serve from the left service court when the serving side has scored an odd number of points in that game. The player of the receiving side who served last shall stay in the same service court from where he served last. The reverse pattern shall apply to the receiver's partner. The player of the receiving side standing in the diagonally opposite service court to the server shall be the receiver. The player of the

receiving side who served last shall stay in the same service court from where he served last. The reverse pattern shall apply to the receiver's partner. The player of the receiving side standing in the diagonally opposite service court to the server shall be the receiver. Order of play and position on court after the service is returned, in a rally, the shuttle may be hit by either player of the serving side and either player of the receiving side alternately, from any position on that player's side of the net, until the shuttle ceases to be in play (Law 15).

Scoring and serving

If the serving side wins a rally, the serving side shall score a point. The server shall then serve again from the alternate service court. If the receiving side wins a rally, the receiving side shall score a point. The receiving side shall then become the new serving side. Sequence of serving in any game, the right to serve shall pass consecutively: from the initial server who started the game from the right service court to the partner of the initial receiver. The service shall be delivered from the left service court to the partner of the initial server to the initial receiver, to the initial server and so on. No player shall serve or receive out of turn, or receive two consecutive services in the same game, except either player of the winning side may serve first in the next game, and either player of the losing side may receive first in the next game. No player shall serve or receive out of turn, or receive two consecutive services in the same game, except either player of the winning side may serve first in the next game, and either player of the losing side may receive first in the next game.

SERVICE COURT ERRORS

service court error has been made when a player: has served or received out of turn; or Has served or received from the wrong service court; if a service court error is discovered, the error shall be corrected and the existing score shall stand.

FAULTS

It shall be a "fault": if a service is not correct; if, in service, the shuttle: is caught on the net and remains suspended on its top; after passing over the net, is caught in the net; or is hit by the receiver's partner; if in play, the shuttle: lands outside the boundaries of the court (i.e. not on or within the boundary lines); passes through or under the net; fails to pass over the net; touches the ceiling or side walls; touches the person or dress of a player; touches any other object or person outside the court; (Where necessary on account of the structure of the building, the local badminton authority may, subject to the right of veto of its Member Association, make bye-laws dealing with cases in which a shuttle touches an obstruction); is caught and held on the racket and then slung during the execution of a stroke; is hit twice in succession by the same player. However, a shuttle hitting the head and the stringed area of the racket in one stroke shall not be a "fault"; is hit by a player and the player's partner successively; or touches a player's racket and does not travel towards the opponent's court; if, in play, a player: touches the net or its supports with racket, person or dress; invades an opponent's court over the net with racket or person except that the striker may follow the shuttle over the net with the racket in the course of a stroke after the initial point of contact with the shuttle is on the striker's side of the net; invades an opponent's court under the net with racket or person such that an opponent is obstructed or distracted; or obstructs an opponent, i.e. prevents an opponent from making a legal stroke where the shuttle is followed over the net; deliberately distracts an opponent by any action such as shouting or making gestures; if a player is guilty of flagrant, repeated or persistent offences under Law 16

LETS

"Let" shall be called by the umpire, or by a player (if there is no umpire), to halt play. It shall be a "let, if: the server serves before the receiver is ready;

during service, the receiver and the server are both faulted; after the service is returned, the shuttle is: caught on the net and remains suspended on its top, or after passing over the net is caught in the net; during play, the shuttle disintegrates and the base completely separates from the rest of the shuttle; in the opinion of the umpire, play is disrupted or a player of the opposing side is distracted by a coach; a line judge is unsighted and the umpire is unable to make a decision; or any unforeseen or accidental situation has occurred. When a “let” occurs, play since the last service shall not count and the player who served last shall serve again.

SHUTTLE NOT IN PLAY

A shuttle is not in play when: it strikes the net or post and starts to fall towards the surface of the court on the striker's side of the net; it hits the surface of the court; or a “fault” or a “let” has occurred.

Table tennis

Table tennis, also known as **ping pong**, is a sport in which two or four players hit a lightweight, hollow ball back and forth to each other with paddles (also known as ‘bats’ or ‘rackets’). The game takes place on a hard table divided by a net. Players must allow a ball played towards them only one bounce on their side of the table and must return it so that it bounces on the opposite side. Points are scored when a player fails to return the ball within the rules. Play is fast and demands quick reactions. A skilled player can impart several varieties of spin to the ball, altering its trajectory and limiting an opponent's options to great advantage. The game is controlled by the International Table Tennis Federation (ITTF), founded in 1926. Since 1988, table tennis has been an Olympic sport which includes four events: men's singles, women's singles, men's teams, and women's teams. The sport is played with two or four players hitting a ball with rackets back and forth to each other on a table, in a manner similar to tennis. The rules are slightly

different, but the concept is quite similar. In singles play, the serve is not required to cross from the server's right-hand court to the receiver's right-hand court (or left to left) as it is in tennis. The sport is played with two or four players hitting a ball with rackets back and forth to each other on a table, in a manner similar to tennis. The rules are slightly different, but the concept is quite similar. In singles play, the serve is not required to cross from the server's right-hand court to the receiver's right-hand court (or left to left) as it is in tennis.

The sport is played with two or four players hitting a ball with rackets back and forth to each other on a table, in a manner similar to tennis. The rules are slightly different, but the concept is quite similar. In singles play, the serve is not required to cross from the server's right-hand court to the receiver's right-hand court (or left to left) as it is in tennis. However, serving across is required in doubles play. Ball spin, speed, placement, strategy and tactics play an important part in competitive table tennis matches. The speed of the ball can vary from slow serves with much spin to smashes that travel as fast as 112.5 kilometers per hour (70 mph).

Facilities and Equipment

The Racket – A wooden rubber faced as mandated by the rules

The Ball – Celluloid spherical white or yellow in color 40 mm in diameter

The Table – measured 5' X 9' and 30" above the surface of the floor

Net – 6' long and 6" wide stretched across the center of the table and extend in both sides by 6"

Analysis of the Game

The Grip – Forehand/Backhand

Serving – push shot serve, top spin serve, back spin serve

Foot work and /stance –proper stance and footwork in serving or receiving are important consideration

Strokes

Forehand/backhand Push shot or half volley
Forehand/backhand top spin
Forehand/backhand drive
Forehand/backhand chop
Forehand/ backhand Smash

Rules of the Game**Single**

1. A game is won by the player who wins 11 pts. except when the score is 10 all, where an advantage of two points is needed in order to win
2. The service and receiving is decided by a toss
3. Server is given 2 service delivery
4. Match is consist of 4 winning games

Service

A good service is done by placing the ball in the open palm of the free hand away from and above the table. The ball must first bounce in the table side of the server before going over the net and bouncing on the table side of the receiver. The receiver must strike the ball after it bounce in his table side in returning to the server.

Points, Let and Scoring

Point is an outcome of any violations
A let is an outcome of a rally which is not score
Rally points is being used

ARNIS

One of the oldest systematic martial arts of the Filipinos. Patterned to a bladed weapon from Malay Known as "Kali" a large bladed weapon use by

the Indonesians for fencing called "Tjakalele" (Yukalele). An extension of the arms was used which is a stick and the fighting form was called Arnis de Mano which has three forms of plays Known as: Espada y Daga – a combination of a long and short dagger. Solo Baston – single stick is used. Sinawali – two sticks being swing in an intricate movement of a criss-cross fashion. Espada y Daga – a combination of a long and short dagger. Solo Baston – single stick is used. Sinawali – two sticks being swing in intricate movements of a criss-cross fashion. Modern Arnis attracted many practitioners because of its interesting features and for being known as Filipino Martial Arts. Its inclusion to the Physical education classes of the Filipinos truly promotes it as an indigenous game.

Equipment

- Rattan Stick – 28" - 32" long and a diameter of ¾ to 1"
- Body Armor – use for official competition in Arnis

Fighting Form

- 12 Striking Technique
- Defensive Stance
- Redondo
- Single Sinawali
- Double Sinawali

Stance and Posture

- Straddle Stance
- Forward Stance
- Back Leaning Stance
- Forward Leaning stance sideward direction
- Forward Leaning stance facing the back
- Cross Stance

Footwork

- Reverse Triangle
- Left and Right side Stepping
- Left side triangle

Essential Elements to Become Good Fighter

- Techniques
- Alertness and Awareness
- Speed
- Power
- Timing
- Proper Delivery of Strikes
- Endurance and Stamina
- Determination
- Confidence
- Yelling

SWIMMING

Swimming is the movement by humans or animals through water, usually without artificial assistance. Swimming is an activity that can be both useful and recreational. Its primary uses are bathing, cooling, travel, fishing, escape, and sport. Animals with lungs have an easier time floating than those without. Almost all mammals can swim by instinct, including bats, kangaroos, moles and sloths. The few exceptions include apes and possibly giraffes and porcupines. Land birds can swim or float for at least some time. Ostriches, cassowaries and tortoises can swim. Juvenile penguins drown if they accidentally fall in water since their down cover is not suited to water.

History

Swimming has been known since prehistoric times; the earliest recording of swimming dates back to Stone Age paintings from around 7,000 years ago. Written references date from 2000 BC. Some of the earliest references include the Gilgamesh, the Iliad, the Odyssey, the Bible (Ezekiel 47:5, Acts 27:42, Isaiah 25:11), Beowulf, and other sagas. Competitive swimming in Europe started around 1800, mostly using breaststroke. Swimming was part of the first modern Olympic Games in 1896 in Athens. In 1902 Richard Cavill introduced the front crawl to the Western world. In 1908, the world swimming association, Fédération Internationale de Natation (FINA), was formed. Butterfly was developed in the 1930s and was at first a variant of breaststroke, until it was accepted as a separate style in 1952.

Non-aquatic animals

Humans do not swim instinctively, but nonetheless feel attracted to water, showing a broader range of swimming movements than other non-aquatic animals (Bender 1999: 119-169). In contrast, many monkeys can naturally swim and some, like the proboscis monkey, crab-eating macaque, and Rhesus macaque swim regularly.

Competitive swimming

The goal of competitive swimming is to be the fastest over a given distance. Competitive swimming became popular in the nineteenth century, and comprises 34 individual events - 17 male events and 17 female events. Swimming is an event at the Summer Olympic Games, where male and female athletes compete in 13 of the recognized events each. Olympic events are held in a 50 meter pool. Competitive swimming international governing body is FINA (Fédération Internationale de Nation), the International Swimming Federation. The four competitive strokes are the butter

fly, backstroke, breaststroke, and freestyle (front crawl). While “freestyle” and “front crawl” are often used interchangeably, freestyle is the more common name and is used in almost all competitive, club-swimming or international competitions. Swimmers generally choose to swim front crawl in a freestyle event since it is the fastest and easiest stroke. Disqualification will occur if the stroke is not swum correctly, for example if the swimmer does not touch the wall with two hands during breaststroke or butterfly.

These strokes can be swum individually or together in an individual medley (IM). The IM order is:

1) Butterfly, 2) backstroke, 3) breaststroke, and 4) freestyle.

There are two types of relays: medley and freestyle.

The medley relay order is:

1) Backstroke, 2) breaststroke, 3) butterfly, and 4) freestyle.

Each of the four swimmers in the relay swims a predetermined distance, dependent on the overall length of the relay.

The three relay lengths are 200 meters or yards, 400 meters or yards, and 800 meters or yards (which is only swum freestyle).

In a 50 meter pool, each swimmer swims one length for the 200 relay, two lengths for the 400 relay, and four lengths for the 800 relay.

In a 25 meter or yard pool, each swimmer swims two lengths for the 200 relay, four lengths for the 400 relay, and eight lengths for the 800 relay.

There have also been 100 yard relays that have been done by 8 and under swimmers, but are very rare except in summer recreation leagues.

Many full-size competition pools in the United States have a length of 50 meters and a width of 25 yards (the Olympic pool size, allowing both short course

(25 m or 25 yd pool) and long course (50 m pool) races to be held.

There are several types of judges:

a starter sends the swimmers off the blocks and may also call a false-start if a swimmer leaves the block before the starter sends them; finish judges make sure the swimmers touch the wall with the appropriate number of hands (one hand for freestyle and backstroke, two for breaststroke and butterfly with the swimmer's hands touching the wall at the same time, not one after another) turn judges check that the swimmers' turns are within rules; stroke judges check the swimmers' strokes; time keepers time the swims; referee along with the starter and the officials make sure everything is running smoothly. If an official catches a swimmer breaking a rule concerning the stroke he or she is swimming, that swimmer is said to be disqualified (commonly referred to as a “DQ”) and the swim is not considered valid.

There are two types of meets:

‘A’ meets are official meets that allow qualification for a special or bigger meet if the qualifying time is met. Scores are kept to see how each team did at the end of the season.

‘B’ meets are used as practice meets, where the normal or prime stroke is swum if not yet qualified. Scores are not kept. Masters swimming is a club sport for adults who have a competitive spirit. Swimming at this level differs from competitive club swimming.

In swim meets masters are allowed to compete in the 50, 100 and 200 of backstroke, fly and breaststroke and the 50, 100, 200, 500 and 1650 of freestyle.

The age groups are organized into 5 year increments (Masters, 1). “Swimming has continually been identified as the best way to exercise. Stress reduction, weight control, cardiovascular fitness, reduced cholesterol, muscle tone and endurance are all positively influenced by exercise.

Masters Swimmers swear by it (Masters, 1)." Shoulder injuries are the most common because of the repetitive motion of freestyle, butterfly, and backstroke. Knee injuries often occur from breaststroke due to the unnatural kick. Incorrect stroke technique can also lead to injuries.]

Changes to the sport

Swimming times have dropped over the years due to better training techniques and to new developments.

The first four Olympics competitions were not held in pools, but in open water (1896- The Mediterranean, 1900- The Seine River, 1904- an artificial lake, 1906- The Mediterranean). The 1904 Olympics' freestyle race was the only one ever measured at 100 yards, instead of the usual 100 meters.

A 100 meter pool was built for the 1908 Olympics and sat in the center of the main stadium's track and field oval. The 1912 Olympics, held in the Stockholm harbor, marked the beginning of electronic timing.

Male swimmers wore full body suits until the 1940s, which caused more drag in the water than their modern swim-wear counterparts.

Competition suits now include engineered fabric and designs to reduce swimmers' drag in the water and prevent athlete fatigue. Also, over the years, pool designs have lessened the drag. Some design considerations allow for the reduction of swimming resistance, making the pool faster.

Namely, proper pool depth, elimination of currents, increased lane width, energy absorbing racing lane lines and gutters, and the use of other innovative hydraulic, acoustic and illumination designs.

The 1924 Summer Olympics were the first to use the standard 50 meter pool with marked lanes. In the freestyle, swimmers originally dove from the pool walls, but diving blocks were incorporated at the 1936 Summer Olympics.

The flip-turn was developed by the 1950s and goggles first were used in the 1976 Olympics.

There were also changes in the late 20th century in terms of technique.

Breaststrokers are now allowed to dip their head completely under water, which allowed for a longer stroke and faster time. In addition, a split stroke in the breaststroke start and turns have been added to help speed up the stroke.

Backstrokers are now allowed to turn on their stomachs before the wall in order to perform a "flip-turn". Previously, they had to reach and flip backwards.

Recreational swimming

The most common purpose for swimming is recreation. Recreational swimming is a good way to relax, while enjoying a full-body workout. Several swimming styles are suitable for recreational swimming; most recreational swimmers prefer a style that keeps their head out of the water and has an underwater arm recovery. Breaststroke, side stroke, head up front crawl and dog paddle are the most common strokes utilized in recreational swimming, but the out-of-water arm recovery of freestyle or butterfly gives rise to better exploitation of the difference in resistance between air and water.

A recreational breaststroke swimmer. The butterfly stroke, which consists of out-of-water recovery with even symmetry in body movements, is most suited to rough water swimming.

For example, in a record-setting example of endurance swimming, Vicki Keith crossed the rough waters of Lake Ontario using butterfly.

Most recreational swimming takes place in swimming pools, and calm natural waters (sea, lakes, and rivers), therefore front crawl is suitable

Swimming as exercise

Swimming is an excellent form of exercise. Because the density of the human body is very similar to that of water, the body is supported by the water and less stress is therefore placed on joints and bones. Swimming is frequently used as an exercise in rehabilitation after injuries or for those with disabilities.

Resistance swimming is one form of swimming exercise. It is done either for training purposes, to hold the swimmer in place for stroke analysis, or to enable swimming in a confined pace for athletic or therapeutic reasons. Resistance swimming can be done either against a stream of moving water (often termed a swimming machine) or by holding the swimmer stationary with elastic attachments.

Swimming is primarily an aerobic exercise due to the long exercise time, requiring a constant oxygen supply to the muscles, except for short sprints where the muscles work anaerobically. As with most aerobic exercise swimming is believed to reduce the harmful effects of stress. Swimming can improve posture and develop a strong lean physique, often called a “swimmer’s build.”

The risks of swimming

A sign warns hikers on the trail to Hanakapiai Beach. Swimming is a healthy activity and enjoys a low risk of injury compared with many other sports. Nevertheless there are some health risks with swimming, including the following: Drowning, inhalation of water arising from adverse water condi-

tions swamping or overwhelming the swimmer or causing water inhalation. Actions of others pushing under water accidentally in play or intentionally, exhaustion or unconsciousness, incapacitation through shallow water blackout, heart attacks, carotid sinus syncope or stroke, adverse effects of immersion

Secondary drowning, where inhaled salt water creates foam in the lungs that restricts breathing, salt water aspiration syndrome. Thermal shock after jumping into water can cause the heart to stop. Exostosis, which is an abnormal growth in the ear canal due to the frequent, long-term splashing of water into the ear canal (Known as Swimmer’s ear.)

Exposure to chemicals, Disinfectant Chlorine will increase the pH of the water, if uncorrected the raised pH may cause eye or skin irritations. Chlorine inhalation; breathing small quantities of chlorine gas from the water surface whilst swimming for long periods of time may have an adverse effect on the lungs, particularly for asthmatics. This problem may be resolved by using a pool with better ventilation, with an outdoor pool having the best results. Chlorine also has a negative cosmetic effect after repeated long exposure, stripping brown hair of all color, turning it very light blonde. Chlorine damages the structure of hair, turning it “frizzy.” Chlorine can dissolve copper which turns blonde hair green. Proper pool maintenance can reduce the amount of copper in the water, while wetting the hair before entering a pool can help reduce the absorption of copper. Chlorine will often remain on skin in an anhydrous form, even after several washings. The chlorine becomes odorous once it is back in an aqueous solution (when salivated on, during a shower, etc.).

Infection

Water is an excellent environment for many bacteria, parasites, fungi and viruses affecting humans depending on water quality. Skin infections from

both swimming and shower rooms can cause athlete's foot (boat bug). The easiest way to avoid this is to dry the space between the toes. Microscopic parasites such as *Cryptosporidium* can be resistant to chlorine and can cause diarrhea illness when swimmers swallow pool water. Ear infections, otitis media, (otitis externa). When chlorine levels are improperly balanced, severe health problems may result, such as chronic bronchitis and asthma.

Swimmers own actions

Overuse injury; competitive butterfly stroke swimmers for example may develop some back pain, including vertebral fractures in rare cases, and shoulder pain after long years of training, breaststroke swimmers may develop knee pain, and hip pain, and freestyle and backstroke swimmers may develop shoulder pain, commonly referred to as swimmer's shoulder (a form of tendinitis). Hyperventilation in a bid to extend underwater breath-hold times lowers blood carbon dioxide resulting in suppression of the urge to breathe and consequent loss of consciousness towards the end of the dive, see shallow water blackout for the mechanism. Adverse water and weather conditions Currents, including tides and rivers can cause exhaustion, can pull swimmers away from safety, or pull swimmers under water. Wind increase waves and can blow a swimmer off course.

Hypothermia, due to cold water, can cause rapid exhaustion and unconsciousness. Sunburn severity can be increased by reflections in the water and the lack of clothing worn during swimming. Long-term exposure to the sun contributes to risk of skin cancer.

Objects in the water

Propeller damage is a major cause of accidents, either by being run over by a boat or entanglement on climbing into a boat. Collision with another swimmer, the pool walls, rocks or boats. Diving into a submerged object,

or the bottom, often in turbid water. Snagging on underwater objects, particularly submerged branches or wrecks. Stepping on sharp objects such as broken glass. Aquatic life Stings from jellyfish and some corals.

Piercing caused by sea urchins, zebra mussels, stingrays. Bites from sharks and other fish and snakes, and pinches from lobsters or crabs. Electrocution from electric rays and electric eels. Organizations publish safety guidelines to help swimmers avoid these risks.

Swimming lessons

A Styrofoam flotation aid can help children learn to swim. Children are often given swimming lessons, which serve to develop swimming technique and confidence. Children generally do not swim independently until 4 years of age. In Sweden, Denmark, Norway and Finland, the curriculum for the fifth grade states that all children should learn how

to swim as well as how to handle emergencies near water. Most commonly, children are expected to be able to swim 200 meters (220 yards) – of which at least 50 meters (55 yards) on their back – after first falling into deep water and getting their head under water. Even though about 95 percent of Swedish school children know how to swim, drowning remains the third most common cause of death among children. In both the Netherlands and Belgium swimming lessons under school time (schoolzwemmen, school swimming) are supported by the government. Most schools provide swimming lessons. There is a long tradition of swimming lessons in the Netherlands and Belgium, the Dutch translation for the breaststroke swimming style is even schoolslag (schoolstroke). The children learn a variant of the breaststroke which is technically not entirely correct.

In many places, swimming lessons are provided by local swimming pools, both those run by the local authority and by private leisure companies. Many schools also include swimming lessons into their Physical Education curricula, provided either in the schools' own pool, or in the nearest public pool. In the UK, the "Top-ups scheme" calls for school children who cannot swim by the age of 11 to receive intensive daily lessons. These children who have not reached Great Britain's National Curriculum standard of swimming 25 meters by the time they leave primary school will be given a half-hour lesson every day for two weeks during term-time. In Canada and Mexico there has been a call for swimming to be included in the public school curriculum.

Swimsuits

Most standard clothing is impractical and unsafe for swimming. In historical cultures, it has been common to swim nude, but in those with taboos against nudity, specialized swimwear has been the norm. Most cultures today expect swimsuits to be worn for public swimming. Modern men's swimsuits are usually shorts, either skintight (jammers) or loose fitting (swim trunks), covering only the upper legs or not at all. Almost always, the upper body is left uncovered. In some cultures, custom and/or laws have required tops for public swimming. Modern women's swimsuits are generally skintight, either two pieces covering only the breasts and pelvic region, or a single piece covering them both plus the torso between them. Skirts are uncommon and short when included, but have been required and sometimes as much as full length in some cultures.

Competitive swimwear seeks to improve upon bare human skin for a speed advantage. For extra speed a swimmer wears a body suit, which has rubber or plastic bumps that break up the water close to the body and provides a small amount of thrust--just barely enough to help a swimmer swim faster.

For swimming in cold water, wetsuits provide thermal insulation. Swim caps keep the body streamlined.

II. SWIMMING FUNDAMENTALS

People can swim in any body of water large enough to permit free movement. These areas include ponds, lakes, rivers, the ocean, and pools. Most people enjoy swimming in water that is between 18° and 29°C (64° and 84°F).

Learning to Swim

In many parts of the world, people learn to swim by imitating others, most often their parents, brothers, sisters, and friends. Most youngsters take lessons at swim clubs, centers, schools, or recreational facilities. In addition, the Philippine Red Cross sponsors programs that teach volunteers about water safety. Instructors teach students skills that will make them safe, efficient, and confident swimmers. Beginners first put their heads in the water and blow bubbles by exhaling. Gradually, students progress to floating, treading water, and ultimately, learning the techniques of the major strokes. Students use various pieces of equipment during these lessons.

Water-wings are inflatable worn around the upper arms; they allow children to float easily. Kickboards are buoyant boards that students can rest their arms on; this keeps their upper bodies afloat and allows them to concentrate on kicking correctly. Paddles are small, firm boards fitted over the hands; they force students to pull their arms through the water correctly. Fins worn on the feet allow swimmers to go faster and to develop proper body position and power.

Hazards and Safety Measures

Individuals should not swim in conditions that their ability and experience will not allow them to handle. For inexperienced recreational swimmers, many safety hazards exist even in a pool.

These hazards include:

- Misjudging a dive and hitting one's head on the bottom
- Holding one's breath too long
- Becoming exhausted
- Experiencing sudden cramps while too far from shore or other swimmers.
- In rivers and oceans, all swimmers should respect the power of nature.
- Powerful waves, tides, and currents can easily overpower even the most experienced swimmers, sweeping them out beyond safety or throwing them into coral or rocks.
- Caves pose additional dangers because swimmers can be trapped inside them.
- Swimmers must follow the instructions of lifeguards and obey posted information about water conditions, tides, and other dangers such as jellyfish or pollution.
- A good precaution for children is the buddy system, in which each child is paired with another while in the water.
- This system ensures that no person is swimming alone and that if an emergency does happen, the lifeguard can be notified immediately.

THE MAJOR STROKES

Four of the five main swimming strokes:

1. Crawl
2. Backstroke
3. Breast Stroke
4. Butterfly Stroke

How to Swim the Freestyle Stroke

The freestyle is a swim style also known as front crawl or sidestroke. It is used in competitions but there is no real regulation on how it has to be swum. Most swimmers chose to swim front crawl during freestyle competition because it is the fastest technique. For individual freestyle competitions, however, a swimmer can use any stroke they want, but during medley competitions they cannot use the breaststroke, butterfly stroke or backstroke.

Step 1 - Visualize a line running down the center of your body from your chin to your chest. This line is the axis upon which your whole body should pivot, and it should extend horizontally in the direction you are swimming.

Step 2 - Keep your legs straight, but not rigid, with your toes pointed out, and kick up and down. Continue kicking the entire time.

Step 3 - Move your arms in a windmill motion opposite each other. While one arm is extended completely out, the other should be all the way back, almost against the side of your body.

Step 4 - Keep your hands flat, thumb separated from the index finger and pull the extended arm through the water beneath your body. Bend your arm at the elbow and draw your fingertips along the imaginary line down the center of your body.

Step 5 - Lift your other arm out of the water and move it all the way forward as the first arm is pulling beneath you. Bend at the elbow and drag your fingertips along the surface of the water. Penetrate the water with your fingertips and completely extend the arm.

Step 6 - Breathe on one side by turning your head to that side as the arm comes out of the water.

How to Swim the Backstroke

Ever wonder how people do the backstroke? Floating on your back, use an up-and-down freestyle kick and windmill stroke to propel yourself. Follow the steps below to learn to get from point A to point B on your back.

Step 1 - Floating on your back in a horizontal position, kick your legs up and down. Keep your legs straight, but not entirely rigid. Your toes should be pointed out. Try not to make a big splash with your kick; just churn the surface of the water.

Step 2 - Pivoting slightly at the waist and rotating your shoulders, windmill your arms. Keep one arm straight as you raise it out of the water from your waist to a fully extended position. At the same time, the other arm should be bent and pulling a cupped hand along your side in the water, from the extended position back down to your side. Your hand should enter the water pinky-first.

Step 3 - Keep your head floating back in the water, with your eyes looking up. Breathe normally.

How to Swim the Breaststroke

This can be a relaxing and gliding swim stroke, or it can be a quick, intense motion if you're racing. It's accomplished by a strong pull, froglike kick and then a long glide. Practice these techniques to improve your breast stroke or to learn it properly for the first time.

Step 1 - Keep your legs close together and pull them up toward your chest. At the same time, hold your palms together and up against your chest, as if in prayer.

Step 2 - Kick out and apart with your legs, and then quickly squeeze them together. Try to imitate the way a frog kicks. After the kick, streamline your body by pointing your toes and extending your arms completely.

Step 3 - Glide for a moment with your arms fully extended, then turn your palms outward and pull with both hands out and around in a circular motion, so that they end up in their original position, together against your chest.

Step 4 - Use the thrust of the pull with your hands to pull your head up and out of the water to take a breath. As your head goes back down, your arms should be just beginning to plunge forward with the next kick.

Step 5 - Glide for a moment, and then repeat the entire motion.

How to Swim the Butterfly Stroke

Ever wonder how swimmers do the butterfly stroke? They whip their legs together and stroke with both arms simultaneously and symmetrically to dive and glide like a dolphin in the water. Here are a few steps to get you swimming like a pro.

Step 1 - Hold your legs together and extend your arms above your head.

Step 2 - Kick your legs up and down once in a whipping motion generating from the hips and bending at the knees, as if you were a dolphin.

Step 3 - Pull both of your arms simultaneously and symmetrically through the water beneath your body along with the big kick, helping to propel your body forward and out of the water.

Step 4 - Lift your head up and breathe as you quickly pull both arms out of the water and swing them forward. Head and arms reenter the water together in a diving motion.

Step 5 - Glide momentarily, performing a smaller follow-up kick.

Step 6 - Execute another pull-through motion with your arms, with your legs performing a full kick to propel you up and out again.

How to Swim the Sidestroke

Swimming on your side is one of the most relaxing recreational strokes. Here's a step-by-step guide to doing it correctly.

Lie in the water on whichever side feels more comfortable. The lower side of your head is in the water, your legs are close together and extended, and your toes are pointed. Holding your feet together, draw your heels up toward your seat as far up as comfortable. Move your top leg forward and your bottom leg backward with your knees bent, so your lower legs resemble scissors opening up. Snap your legs together in a scissor kick. When your legs meet they should be extended as in the starting position. Extend your bottom arm ahead of you, palm down beneath the surface of the water. Your top arm lies alongside your top leg. Sweep your bottom arm from its extended position down through the water. When it's pointed nearly straight down, bend your elbow and sweep your hand up to your chest. Slide your top hand sideways through the water from your thigh to your chest. The force of your stroke is transferred from your bottom hand to your top hand. Sweep your top arm back down to the starting position, pushing water down toward your feet, while extending your bottom arm forward again. Synchronize the timing of your arms and legs so you're snapping your legs together at the same time your arms meet at your chest. Glide at the end of each stroke.

PART II – ANALYZING TEST ITEMS

Athletics

- 5,000 M.R is _____ lap in the oval.
a. 25 b. 13 c. 7 d. 4
- There are _____ water jumps in steeplechase.
a. 5 b. 12 c. 7 d. 14
- One round in the oval is _____
a. 100 M b. 500 M c. 600 M d. 400M
- Triple jump is done by a _____, step, and jump.
a. hop b. walk c. run d. skip
- There are _____ hurdles in the hurdling events.
a. 10 b. 12 c. 14 d. 16
- Heptathlon is composed of _____ events.
a. 6 b. 7 c. 8 d. 9
- Decathlon is composed of _____ running events.
a. 8 b. 4 c. 6 d. 3
- 100 M, 400 M and _____ meter are all sprint events.
a. 800M b. 1,500 M c. 200 M d. 300 M
- There are _____ obstacles including the water jump in the steeplechase
a. 3 b. 4 c. 5 d. 6
- The official responsible for the proper carrying out of the program in an Athletic meeting is the _____.
a. Technical Manager b. Clerk of Court
c. Field Manager d. Meet Manager

Badminton

11. A game is played to ____ points?
a. 11 b. 15 c. 20 d. 21
12. Any infraction of the rules where the resulting penalty is loss of serve?
a. Fault b. Rally c. Side Out
13. An overhead stroke hit downward with force -usually used to score a point?
a. Clear b. Drive c. Drop Shot d. Smash
14. Playing singles, your score is 4, the opponent 3, which serving court do you serve from?
a. Left b. Right c. Center
15. A high shot that travels to the back of your opponents court?
a. Clear b. Drive c. Drop Shot d. Smash
16. The service box in a singles game is:
a. short and narrow b. long and narrow
c. long and wide d. short and wide
17. A legal service is done by hitting the shuttle
a. between your waist and shoulders
b. anywhere from your shoulders down
c. anywhere below your wrist
d. below the knee
18. Your score is 8, where you going to serve?
a. left service box across to the right
b. left service box straight across to the left
c. right service box straight across to the right
d. right service box across to the left.

19. Before the start of the game, the winners of the racquet spin or shuttle toss may choose:
a. to serve or to receive
b. to serve and side of court
c. to serve or side of court
d. to give the options to your opponent
20. The most common service being used in doubles games is:
a. short and low b. long and low
c. high and long d. short and high

Table Tennis

21. When the ball hits permanent fixtures during play it is called:
a. A 'let' and the point are replayed.
b. A good hit and play continues.
c. Fault by the player who strikes it
d. A dead ball
22. In a game of doubles the serve is taken from –
a. Behind the back line.
b. The service court of the serving teams choice.
c. The left service court.
d. The right service court.
23. What happens if the ball touches the net during the serve but continues to land in the correct service area?
a. It is referred to as a 'let' and the serve is taken again.
b. It is a fault and service is awarded to the opponent.
c. Play continues, as it is a correct serve.
d. The point is awarded to the receiver.

24. If the player in the act of service misses the ball completely –
a. They may serve again from the same area.
b. They may serve again but from the other service court.
c. They lose the serve.
d. Their opponent receives a point but they continue to serve.
25. An overhead stroke hit downward with force -usually used to score a point?
a. Clear b. Drive c. Drop Shot d. Smash
26. A game is played up to ____
a. 11 points b. 15 points c. 20 points d. 21 points
27. If a player in the act of service misses the ball completely –
a. he may serve again from the same area.
b. he may serve again but from the other service end.
c. he lose a point
d. he lose a point but continue to serve
28. The length of the table is ____
a. 9 ft. b. 7 ft. c. 8 ft. d. 10 ft.
29. The winner of the toss has the option:
a. to serve or to receive
b. to serve, not to serve, or side of court
c. to serve or side of court
d. to serve or to give the opponent the option
30. In serving the ball must:
a. be nearer to the table than server's body
b. be dropped before being hit
c. be place on the palm of the server's free hand
d. be anywhere at the end of the table of the server

ARNIS

31. What is the Filipino martial art of stick fighting?
a. Kali b. Kuntao c. Arnis d. Escrima
32. Who is the father of modern arnis?
a. Ernie A. Presas b. A. Sotoca
c. Remy A. Presas d. Roberto Presas
33. Tjakalele is a native Indonesian fencing art with technique closely similar to ____.
a. Kali b. Arnis c. Espada y Daga d. Redonda
34. This is a system of fighting with bladed weapons among maharlikas known as ____
a. Kali b. Arnis c. Espada y Daga d. Redonda
35. What school is teaching kali to the children as part of the curriculum during the reign of the datus of Panay?
a. Bothoan b. Kuntao c. Moro-moro d. Maojapahit

SWIMMING

36. The stroke that is being interchangeably known as freestyle
 - a. Crawl
 - b. Breast
 - c. fly
37. Almost all mammals can swim by instinct except:
 - a. kangaroos
 - b. bats
 - c. porcupines
38. A standard Olympic pool measure:
 - a. 50 m
 - b. 75 m
 - c. 100 m
39. The official who looks if the swimmers do the correct strokes in competition is:
 - a. Turn judge
 - b. Stroke judge
 - c. referee
40. The fastest stroke use in competitive swimming is the:
 - a. Backstroke
 - b. Crawl
 - c. Butterfly

PART III – ENHANCING TEST TAKING SKILLS

ATHLETICS

1. The athletic meet official who is responsible for the preparation of the Result cards, timekeeping cards and all other implements for competition is the _____.
 - a. recorder
 - b. meet manager
 - c. technical manager
 - d. referee
2. Who is the official responsible for allowing only officials on duty and competitors taking part in the events that are in progress to be in the area?
 - a. the referee
 - b. announcer
 - c. the marsha
 - d. manager of the meet
3. The officials on duty at the change-over zones in relay races are the _____.
 - a. Track Judges
 - b. umpires'
 - c. Marshals
 - d. Asst. Technical Manager
4. In all National & International Meetings, starting blocks must be used for all races up to and including.
 - a. 400M
 - b. 200M
 - c. 800M
 - d. 110M
5. Any breach of the rules that is observed by the _____ should be indicated immediately by the raising of a red flag.
 - a. technical manager
 - b. meet manager
 - c. chief judge
 - d. referee
6. The official who is responsible to allocate duties to the judges is the
 - a. technical manager
 - b. meet manager
 - c. chief judge
 - d. jury of appeal

7. A distinctive flag or marker may be used to mark the best throw of each competitor in the following events.
 - a. javelin only
 - b. hammer & discus only
 - c. for all throwing event
 - d. for all throwing event except shot put
8. A throw made by a competitor in the discuss event is disqualified because
 - a. The competitor leaves the circle before the discus has landed
 - b. The discus breaks after landing
 - c. He has put rising powder on his hands
 - d. The discuss lands within the landing area and rolled out.

BADMINTON

9. If the serving player misses the shuttle he:
 - a. may serve again from the same area.
 - b. may serve again but from the other service court.
 - c. lose the serve.
 - d. may reserve again
10. During service when the shuttle touches the net but continues to land in the proper service box it is:
 - a. a 'let' and the serve is taken again.
 - b. a fault and service is lost to the opponent.
 - c. a good serve.
 - d. A fault and a point is awarded to the receiver.
11. A player shouts "out" to prevent his partner to hit the shuttle is a:
 - a. Form of assistance from a team member.
 - b. Communication between partners that is not allowed.
 - c. Technical violation of team members.
 - d. Stoppage of game and warning should be given to the team.

12. One of the following is a serving violation:
 - a. The foot of the server is toeing the short service line
 - b. One foot is not in contact to the ground.
 - c. Feet are far apart
 - d. The feet are in contact to the ground.
13. In a game of doubles the first serve is taken from –
 - a. The long service line of the right service box
 - b. The doubles alley of the serving teams choice.
 - c. The left service box.
 - d. The right service box.
14. When a shuttle touches a permanent fixture it is:
 - a. a 'let'.
 - b. a good return
 - c. a fault.
 - d. a must for the opponent to reach for it.
15. When serving, the racket head should:
 - a. be pointing to the floor.
 - b. be higher than the waist
 - c. be below the knees at impact.
 - d. be below the racket hand at impact.

TABLE TENNIS

16. The ball is ____ from the last moment at which it is stationary on the palm of the free hand before being intentionally projected in service until the rally is decided as a let or a point.
 - a. Dead
 - b. Alive
 - c. Let
 - d. Serve

17. A ____ is the period during which the ball is in play.
a. rally b. Alive c. Let d. Serve
18. A ____ is a rally of which the result is not scored.
a. Dead b. Alive c. Let d. Serve
19. The player due to strike the ball second in a rally.
a. Server c. Server's partner
b. Receiver d. Receiver's partner
20. A ____ is a rally of which the result is scored.
a. Dead b. Alive c. Let d. Point
21. Anything that a player ____ includes anything that he was wearing or carrying, other than the ball, at the start of the rally.
a. Used b. Wear c. Bear d. Bring
22. The ____ is the hand carrying the racket.
a. Left hand c. Racket hand
b. Right hand d. Free hand
23. The ball shall be regarded as passing ____ the net assembly if it passes anywhere other than between the net and the net post or between the net and the playing surface.
a. Over b. Under c. Around d. About
24. The ____ is the hand not carrying the racket; the free arm is the arm of the free hand.
a. Left hand c. Racket hand
b. Right hand d. Free hand
25. A player ____ the ball if he touches it in play with his racket, held in the hand, or with his racket hand below the wrist.
a. Strike b. Hit c. Smash d. Drive

ARNIS

26. A sharp pointed hardwood stick hardened by fire called
a. Muton c. Kali
b. Espada y Daga d. Dolo-dolo
27. Depict the traditional striking technique of arnis in a form of free hand exercise.
a. Sinawali b. Anyo c. Doblete d. Redonda
28. In what aspect of arnis does the learner taught the how and where to deliver a strike?
a. Blocking Technique c. Striking Techniques
b. Stances d. Body shifting
29. Double stick striking criss-across fashion and strike called:
a. Sinawali c. Bandy-banday
b. Redonda d. Palis-palis
30. What is the target vital area of single sinawali?
a. Temple/Knee c. Forehead/leg
b. Shoulder/hip d. Chest/abdomen

Team Sports

Prepared by:

Dr. Rosalina Elizabeth N. Edralin

Competencies:

1. Recall the historical background of the different team sports.
2. Identify the facilities and equipment use in the sport.
3. Mechanical analysis of the basic skills.

PART I - CONTENT UPDATE

TEAM SPORTS

BASKETBALL

A. HISTORY

1. Basketball came to existence through the ingenuity of Dr. James Naismith.
2. It was first played in 1891 at Springfield, Massachusetts, YMCA.
3. The first ball used was a soccer football, because of its ability to bounce uniformly.
4. The first baskets were peach baskets suspended from the traditional running track of so many gymnasiums built in that period.
5. Heights of the baskets were determined by the running track or balcony height.
6. The first team had nine players, three forwards, three centers, and three guards.
7. Later it became optional to reduce five, and finally five was selected as the best number.
8. As late as 1950, a total of 16 foreign nations had hired Americans to teach the game abroad, conduct clinics, and act as consultants in schools and cities.
9. Basketball was first used in Olympic Games in 1936 in Berlin where the United States toyed with all oppositions.

B. FACILITY AND EQUIPMENT

1. **Playing Court** – Length – 28 meters; Width – 15 meters
- Boundary line

- Center line, center circle and semi-circles
- Free throw lines, restricted areas and free-throw rebound places
- Three point field goal area
- Team bench areas

2. Equipment

- Backstop units, consisting of:
 - Backboards
 - Baskets comprising rings and nets
 - Backboard support structures including padding
- Basketballs
- Game clock
- Scoreboard
- Twenty-four second device
- Stopwatch or suitable device (not the game clock) for timing time-outs
- Two separate, distinctly different and loud signals
- Score sheet
- Player foul markers
- Team foul markers
- Alternating possession arrow

C. MECHANICAL ANALYSIS OF THE BASIC SKILLS

1. **PASSING** – Regardless of which pass is used, certain factors are common to all passes.
 - a. For firm control, hold the ball with the thumb and finger pads and not with the palms of the hands.
 - b. Passer step forward in the direction of the receiver. Passes should be made with a quick arm extension and a snap of the wrists, with thumbs and fingers providing momentum.

- c. After the pass is released, the palms should be facing the floor.
 - d. Avoid telegraphing the direction of the pass. Learn to use peripheral vision and keep eyes moving from place to place to develop an awareness of the teammates' positions.
 - e. Anticipate the spot toward which a teammate will be moving to receive the pass.

2. **CATCHING** – Receiving the ball is a most important fundamental skill. Many turn overs involve failure to handle a pass properly.

- a. Move toward the pass with the fingers spread and relaxed, reaching for the ball with elbows bent and wrists relaxed.
 - b. Hands “give” as the ball comes in.

3. **DRIBBLING** – It is used to advance the ball, break for a basket, or maneuver out of a difficult situation.

- a. The knees and trunk are slightly flexed, hands and eyes forward. Peripheral vision is important. Do not look beyond the ball and see it in the lower part of the visual area.
 - b. The ball is propelled by the fingertips with the hand cupped and relaxed. There is a little arm motion. Push rather than slap the ball.
 - c. The dribbling hand should be alternated.

4. **SHOOTING** – The primary objective of the game is to score goals.

- a. Both the toes and the shoulders face the basket. The weight is evenly distributed on both feet. The ball is held between the shoulder and eye level.
 - b. A comfortable grip, with fingers well spread and the ball resting on the pads of the fingers is essential. One should be able to see daylight between the palm of the hand and the ball.

- c. The eye is fixed on the target (the rim or the backboard) for the rest of the shot. As the shot starts, the wrist is cocked.
 - d. The follow-through imparts a slight backspin to the ball. The arms are fully extended, the wrist is completely flexed, and the hand drops down towards the floor. The arch should be 45 degrees or a little higher.
5. **PIVOTING** – It is a maneuver that protects the ball by keeping the body between the ball and the defensive player.
- a. The ball is held firmly in both hands, with elbows out to protect it.
 - b. One foot, the pivot foot, must always be in contact with the floor. Turning on that foot is permitted, but it must not be dragged away from the pivot spot. The lead foot may, however, step in any direction.

SOFTBALL

A. HISTORY

1. George Hancock of Chicago, Illinois, started the game softball in 1889 and Lewis Rober of Minnesota in 1895.
2. The game took different names at different times such as playground ball, kitten ball, recreation ball, four old cats, and ladies ball.
3. Walter Hakanson gave the official name of Softball.

B. FACILITY AND EQUIPMENT

1. **Playing Field** – It is the area within which the ball may be legally played and fielded. It has a clear and unobstructed area within the minimum radius of 220 ft. for junior and women fast pitch; or 250 ft. for junior and men fast pitch.

- The One meter (3 ft.) line is drawn parallel to and 0.91 m (3 ft) from the baseline, starting at a point halfway between home plate and first base.
 - The Batter's On-Deck circle is a 1.52m (5 ft) circle 0.76m (2 1/2 ft) radius placed adjacent to the end of players' bench or dugout area closest to the home plate.
 - The Batter's Box, one on each side of home plate, 3 ft by 7 ft.
 - The Catcher's Box 10 ft in length from the rear outside corners of the batters' boxes and 8' 5" wide.
 - Each Coach's Box is behind a line 15 ft drawn outside the diamond. The line is parallel to and 12 ft5 from the first and third baselines, extended from the bases toward home plate.
 - The Home Plate is made of rubber. It is a five sided figure 17 inches wide, across the edge facing the pitcher. The sides is parallel to the inside lines of the batter's box and 8 ½ inches long. The sides of the point facing the catcher are 12 inches long.
 - The Pitcher's Plate is made of rubber 24 inches long and 6 inches wide.
 - a. The top of the plate shall be level with the ground
 - b. The front line of the plate shall be the following distance from the outside corner of home plate:
 1. Male Fast Pitch (Adult and Junior) – 14.02m (46 ft);
 2. Female Fast Pitch (Adult and Junior) – 13.11m (43 ft)
 - The Bases, other than home plate is 15 inch square and shall be made of canvas or other suitable material, and not more than 5 in inches thickness. The bases should be securely fastened in position.
2. **Bat** is round and smooth and not more than 34 inches long and 38 ounces in weight.

3. **Ball** is 12 ½ inches in circumference and 6 ¼ ounces in weight.
5. **Gloves and Mitts** – Any player may wear a glove, but only the catcher and first baseman may use mitts.
4. **Shoes** should be worn by all players.

C. MECHANICAL ANALYSIS OF THE BASIC SKILLS

1. Gripping the Ball

- a. The thumb is on one side, the index and middle fingers on top, and the other fingers supporting along the other side.

2. Throwing

Overhand Throw

- a. Secure a firm grip on the ball, raise the throwing arm to shoulder height and bring the elbow back.
- b. The hand with the ball is then brought back over the head so it is well behind the shoulder at about shoulder height.
- c. The left side of the body is turned in the direction of the throw, and the left arm is raised in front of the body.
- d. The weight is on the back (right) foot, with the left foot advanced and the toe touching the ground.
- e. The arm comes forward with the elbow leading, and the ball is thrown with a downward snap of the wrist.
- f. The body weight is brought forward into the throw, shifting to the front foot.
- g. There should be a good follow-through so the palm of the throwing hand faces the ground at completion of the throw.

- h. The eye should be on the target throughout, and the arm should be kept free and loose during the throw.

Sidearm Throw is much the same as the overhand throw, except that the entire motion is kept near a horizontal plane. It is used for shorter, quicker throws and employs a whip like action.

- a. Swing the arm out from shoulder and around parallel to the ground.
- b. The throw curves more because a side-spinning action is usually imparted to the ball on release.
- c. There is generally some body lean toward the side of the throwing arm.

Underhand Throw

- a. The throwing hand and arm brought back, with palm facing forward, in a pendulum swing. The elbow is bent slightly.
- b. The weight is mostly on the back foot.
- c. The arm comes forward, almost in a bowling motion, and the ball is tossed. The weight shift to the front foot during the toss.
- d. The flight of the ball should remain low & arrive at about waist height.

3. Pitching

Slingshot Delivery

- a. Grip the ball with index finger and middle finger on top of the ball with the ring finger to the side and thumb underneath. Both feet must be in contact with pitcher's plate, facing the batter, and holding the ball momentarily in front with both hands.
- b. The pitcher takes one hand from the ball, extends the right arm forward, and brings it back in pendulum swing, positioning the ball well behind the body.

- c. A normal stride taken toward the batter with the left foot begins the throwing sequence for a right-handed pitcher.
- d. The arm is brought forward with an underhanded slingshot motion, and the weight is transferred to the leading foot.
- e. Only one step is permitted. The follow-through motion is important.

Windmill Delivery is an alternate pitching motion in which the arm describes a full arc overhead, moving behind the body and then forward toward the batter.

- a. The arm goes into full extension on the downward swing in the back, gathering momentum as the forward motion begins.
- b. The pitch is otherwise the same as the normal motion.

4. Fielding

Fly Balls

- a. For a low ball, the fielder keeps the fingers together and forms a basket with the hands.
- b. For a higher ball, the thumbs are together, and the ball is caught in front of the chin.
- c. The fielder should give with her hands, and care must be taken with a spinning ball to squeeze the hands sufficiently to stop the spinning.
- d. The eye is on the ball continually until it hits the glove or hands.
- e. The knees are flexed slightly when receiving and aid in giving when the ball is caught.

Grounders

- a. The fielder should move as quickly as possible into the path of the ball and then move forward and play the ball on a good hop.

- b. The eyes must be kept on the ball, following into the hands or glove.
- c. The feet are spread, the seat is kept down, and the hands are carried low and in front. The weight is on the balls of the feet or on the toes, and the knees are bent to lower the body.
- d. As the ball is caught, the fielder straightens up, takes a step in the direction of the throw, and makes the throw.

5. Batting

- a. The batter stands with the left side of the body toward the pitcher. The feet are spread and the weight is on both feet. The body should be facing the plate.
- b. The bat is held with the trademark up, and the left hand grasps the bat lower than the right. The bat is held over the right shoulder, pointing both back and up. The elbows are away from the body.
- c. The swing begins with a hip roll and a short step forward in the direction of the pitcher. The bat is then swung level with the ground at the height of the pitch.
- d. The eyes are kept on the ball until it is hit. After the hit, there must be good follow-through.

6. Base Running

- a. In running to first base, run in all out sprint. Run through first base to the other side without slowing.
- b. In rounding bases, touch base with outside foot, do not break stride. Use banana approach, turn sharply and accelerate away from base.
- c. In sliding, the slide begins 10 feet from base. Hands and arms are extended in most of the slides.

VOLLEYBALL**A. HISTORY**

1. William G. Morgan of Holyoke City, Massachusetts created a game called Mintonette in 1895.
2. Dr. A. F. Halstead renamed it to Volleyball.
3. Elwood S. Brown introduced it in the Philippines in 1910.
4. It was first played as demonstration sport in the 1964 Tokyo Olympics.

B. FACILITY AND EQUIPMENT

1. **Playing Area** – It includes the playing court and the free zone. It shall be rectangular and symmetrical.
 - a) The playing court is a rectangle measuring 18 x 9 m, surrounded by a free zone which is a minimum of 3 m wide on all sides.

The free playing space is the space above the playing area which is free from any obstructions. The free playing space shall measure a minimum of 7 m in height from the playing surface.

Lines on the Court

Boundary lines
Center line
Attack line

Zones and Areas

Front Zone
Service Zone
Substitution Zone
Libero Replacement Zone

Warm-up Area
Penalty Area

2. Net

- a. The net is placed vertically over the center line whose top is set at the height of 2.43 m for men and 2.24 m for women.
- b. It is 1 m wide & 9.50 to 10 m long, made of 10 cm square black mesh.
- c. Two side bands are fastened vertically to the net and placed directly above each sideline.
- d. An antennae is a flexible rod 1.80 m long and 10 mm in diameter. It is fastened at the outer edge of each sideband.

3. Posts

- a. The posts supporting the net are placed at a distance 0.50 -1.00 m outside the sidelines. They are 2.55 m high and preferably adjustable.
- b. The posts are rounded and smooth, fixed to the ground without wires.

4. Balls

- a. The ball shall be spherical, made of a flexible leather or synthetic leather case with a bladder inside made of rubber or a similar material.
- b. Its color may be a uniform light color, or a combination of colors.
- c. Its circumference is 65-67 cm and its weight is 260-280 g.

C. MECHANICAL ANALYSIS OF THE BASIC SKILLS**1. SERVING**

Underhand Serve

- a. The server stands facing the net with the left foot slightly forward and the weight on the right foot.
- b. The ball is held in the left hand with the left arm across and a little in front of the body.
- c. The ball is lined up with a straight forward swing of the right hand. The left-hand fingers are spread, and the ball rests on the pads of these fingers.
- d. On the serving motion, the server steps forward with the left foot, transferring the weight to the front foot, and at the same time brings the right arm back in preparatory motion.
- e. The right hand now swings forward and contacts just below the center. The ball can be hit with an open hand or with the fist (facing forward or sideward).
- f. An effective follow-through with the arm ensures a smooth serve.

Overhand Serve

- a. The server stands with the left foot in front and the left side of the body turned somewhat toward the net. The weight is on both feet.
- b. The ball is held in the left hand directly in front of the face. The ball must be tossed straight up and should come down in front of the right shoulder.
- c. As the ball is tossed, the weight shifts to the back foot. The height of the toss is a matter of choice, but from 3 to 5 feet is suggested.
- d. As the ball drops, the striking arm comes forward, contacting the ball a foot or so above the shoulder. The weight is shifted to the forward foot, which can take a short step forward. The contact is made with the open palm or with the fist. An effective serve is one that has no spin – a floater.

2. Passing (or Returning)

Forearm Pass (Underhand Pass)

- a. The body must be in good position to ensure a proper volley. The player must move rapidly to the spot where the ball is descending to prepare for the pass.
- b. The trunk leans forward and the back is straight, with a 90 degree angle between the thighs and the body. The body is bent, and the body is in partially crouched position, with the feet shoulder apart.
- c. The hands are clasped together, so that the forearms are parallel. The clasp should be relaxed, with the type of handclasp a matter of choice. The wrists in either case are turned downward, and the elbow joints are reasonably locked.
- d. The forearms are held at the proper angle to rebound the ball, with contact made with the fists or forearms between the knees as the receiver crouches.

Overhand Pass

- a. The passer moves underneath the ball and controls it with the finger tips. Feet should be in an easy, comfortable position, with knees bent.
- b. The cup of the fingers is made so that the thumbs and forefingers are close together and the other fingers are spread. The hands are held forehead high, with elbows out and level with the floor.
- c. The passer contacts the ball at above eye level and propels it with the force of spread fingers, not with the palms. At the moment of contact, the legs are straightened and the hands and arms follow-through.
- d. If the ball is a pass to a teammate, it should be high enough to allow for control. If the pass is a return to the other side, it can be projected forward with more force.

3. Spiking

- a. **Approach** – Take 3-4 steps near the side and attack lines with the last step taken with the stronger leg.
- b. **Step-close take –off**- Transfer the momentum of the body into a vertical direction. Heels of both contact the floor with the weight shifted forward to the toes during the last step.
- c. **Arm movements** – Swing both arms forward and upward during the take- off. Extend left arm directly upward above the shoulder and the right arm is bent into a throwing position. Left elbow leads the swing, followed by an extension of the spiking arm. Contact ball with the heel of the open hand. To impart a spin, snap wrist over the ball.
- d. **Blocking** – Jump into the air directly in front of the spike, with the arms extended in an effort to block the ball and at the same time to rebound it off the arms into the spiker's court.

PART II – ANALYZING TEST ITEMS

Competency No. 1. Recall the historical background of different team sports.

1. Who created the game of basketball?
 - A. Walter A. Hakanson
 - C. Kareem Abdul Jabbar
 - B. James A. Naismith
 - D. William J. Morgan

The correct answer is **B**.

Dr. James A. Naismith was a member of the teaching staff of the International Training School at Springfield, Massachusetts. He conceived the game as a solution to the problem of the school's winter Physical Education program. A peach basket was first used as the hoop. After each score the ball had to be taken out of the basket before the play could be resumed.

Option A and D: they were both inventors of sports. Walter A. Hakanson was the first person to first call the game softball while William J. Morgan created a game called Mintonette or volleyball.

Option C: Kareem Abdul Jabbar was one of the best players in the NBA.

Competency No. 2. Identify facilities and equipment.

2. What equipment is worn by the catcher in softball for safety?
 - A. Mask and body protector
 - C. Mask and Mitt
 - B. Glove and Uniform
 - D. Spikes and Mask

The correct answer is **A**.

A mask, throat guard and chest guard must be worn by catcher in fast pitch and are recommended in slow pitch softball.

Option B: Glove and uniform is required to be worn by all players in a softball; game.

Option C: Mask is worn by the catcher, but mitt is limited to first baseman and catcher.

Option D: Spikes or any other type of sharp projections on the shoes are usually prohibited except in higher levels of competition.

Competency No. 3. Recognize bio-mechanics and skills.

3. What is the position of the spiker's hand at the beginning of the forward swing to hit the ball?
 - A. Over the spiker's head
 - B. Over the spiker's right shoulder
 - C. Out to the side of the spiker's shoulder
 - D. Above and slightly behind the spiker's head

The correct answer is **D**.

The ball is contacted just in front of the hitting shoulder. The greater the distance the ball is in front of the spiker, the lower it drops before contact and the greater the chance of it being hit into the net.

Options A, B, and C: All three options results in one common error. Balls contacted over the right, out to the side of the piker's shoulder, and over the spiker's head, the hard driven spike consistently go-out-of bounds.

BASKETBALL

4. What was the original type of basket used for basketball?
 - A. peach basket
 - B. sewing basket
 - C. fish basket
 - D. trash basket
5. Which is used for timing periods of play and intervals between them?
 - A. 24-second device
 - B. Game clock
 - C. Stopwatch
 - D. Wristwatch
6. Which movement would be most efficient when shooting a lay-up from the right side of the basket?
 - A. Take off from the left foot, shoot with right hand.
 - B. Take off from right foot, shoot with right hand.
 - C. Take off from left foot, shoot with both hands.
 - D. Stand on both feet, shoot with right hand.
7. Which statement concerning the pivot is untrue?
 - A. It is an offensive maneuver.
 - B. It is a defensive maneuver.
 - C. It is a method of evading an opponent.
 - D. It is executed by lifting both feet from the floor.
8. What is the most significant factor to stress when executing a pass?
 - A. handling the ball with the fingers
 - B. using a wrist snap upon release
 - C. stepping into the pass
 - D. keeping the elbows in
9. What is the most executed factor in the execution of an accurate bounce pass?
 - A. Lowering the release point
 - B. Rotating the wrists inward

- C. Initiating the pass with a stride
 - D. Having correct point of contact on the floor
10. Where should a player's eyes be focused when dribbling?
- A. downward in order to control the ball
 - B. forward in order to pass to a teammate
 - C. forward in order to alternate hands quickly
 - D. downward in order to see the feet of a defensive player.

SOFTBALL

11. In what city did softball originate?
- A. Springfield, Massachussetts
 - B. Detroit, Michigan
 - C. Chicago, Illinois
 - D. Cleveland, Ohio
12. What equipment is worn by the catcher for safety?
- A. mask and mitt
 - B. cleats and mask
 - C. glove and uniform
 - D. mask and body protector
13. When is the sidearm throw used most often?
- A. When the pitcher is pitching
 - B. when the infielders used to make a good throw
 - C. When the right fielder is attempting to throw out a base runner at the first base
 - D. When the catcher is attempting to throw out a runner stealing second base
14. Which grip should be used if the batter wants to hit a long ball?
- A. hands spread about 2 inches
 - B. hands together at the bottom of the bat
 - C. hands together about 1 inch from the bottom of the bat
 - D. hands together about 3 inches from the bottom of the bat

15. What is the most important consideration for an infielder when fielding a ground ball?
- A. Charging the ball
 - B. Getting in front of the ball
 - C. Getting the glove down immediately
 - D. Keeping the weight on the balls of the feet
16. What technique is used to pitch an incurve?
- A. rotate wrist upward
 - B. rotate wrist to the left
 - C. rotate wrist downward
 - D. rotate wrist to the right
17. What is the correct procedure for a right- handed person to use on an over head throw?
- A. Face the target, step ahead on the left foot.
 - B. Face the target, step ahead on the right foot.
 - C. Left shoulder toward target, step ahead on the right foot.
 - D. Left shoulder toward target, step ahead on the left foot.

VOLLEYBALL

18. William G. Morgan invented a game in 1895. What team sport is this?
- A. Volleyball
 - B. Basketball
 - C. Softball
 - D. Soccer Football
19. What is the dimension of the volleyball playing court?
- A. 28 meters x 15 meters
 - B. 225 feet x 220 feet
 - C. 9 meters x 18 meters
 - D. 22 feet x 40 feet
20. In hitting the forearm pass, what is the reason for hitting the ball on the inner part of the forearms?
- A. So the pass will be legal.
 - B. So the ball can be hit below the waist.

- C. So there is a flat surface for rebounding the ball.
 - D. So the speed of the oncoming ball can be absorbed.
21. What movements contribute to the height of the jump in hitting a spike?
- A. leg extension
 - B. arching the back
 - C. upward movement of the arms
 - D. leg extension and upward movement of the arms
22. What parts of the hands should contact the ball in hitting the overhand pass?
- A. the finger pads and thumbs
 - B. the heels of the hands, finger pads, and thumbs
 - C. the palms of the hands, finger pads, and thumbs
 - D. the thumbs and finger pads of the first two fingers
23. When should the blocker extend his or her arms upward for the block?
- A. just before reaching the peak of the jump
 - B. as he or she jumps upward to block the ball
 - C. as he or she moves into position to jump for the block
 - D. as the spiker begins the forward motion for the spike
24. What direction should a player face when preparing to jump to block a spike?
- A. sideways to the net
 - B. squarely facing the net
 - C. facing the opposing team's setter
 - D. facing the line of the spiker's approach
25. Where is the ball held when the server is going to hit an overhand serve?
- A. Waist high, diagonal to the right side line
 - B. Waist high, directly toward the right side line
 - C. chest high, toward the net and in line with the right shoulder
 - D. Chest high, toward the net and in line with the left shoulder

PART III – ENHANCING TEST TAKING SKILLS

1. When does the timer stop the clock?
- A. When the official gives the hand signal.
 - B. When the scorers' buzz alerts the official of a substitution.
 - C. When the official's whistle blows.
 - D. When two opposing players collide attempting to get a loose ball.
2. How many seconds may a defensive player stay in the lane?
- A. 3 seconds
 - B. 5 seconds
 - C. 10 seconds
 - D. No time limit
3. If after receiving a pass a player makes a two-step stop, what is he permitted to do?
- A. Pivot in any directions on the front foot.
 - B. Pivot in any directions on the back foot.
 - C. Pivot in any directions on either foot.
 - D. Pivot in any directions on both feet.
4. A foul is committed against a player who is able to make the goal in spite of the fouls. Does the shot counts?
- A. No, a free throw is awarded.
 - B. No, a jump ball is called.
 - C. Yes, a free throw is awarded.
 - D. Yes, the other team takes the ball out of bounds
5. The offensive team plays a fast break, what is the best shot for the player close to the basket do?
- A. Lay-up shot
 - B. Set shot
 - C. Jump shot
 - D. Fall away shot

6. A violation is committed by the defensive team and the ball is out of play. The ball situation is called
 - A. Jump ball
 - B. Dead ball
 - C. Time-out
 - D. Delay of game
7. Player A is cutting for the basket and runs into Player B who has established a guarding position. What is the official's decision?
 - A. Blocking on Player A
 - B. Blocking on Player B
 - C. Charging on Player B
 - D. Charging on Player A
8. An offensive player happened to return the ball to the back court and a violation occurs. What is the penalty for the violation?
 - A. Jump ball
 - B. One free throw
 - C. Two free throws
 - D. Opponent's ball out-of-bounds
9. An inning is that portion of a game within which the teams alternate on offense and defense. For an official game the minimum number of innings is
 - A. Seven
 - B. Six
 - C. Five
 - D. Four
10. For a pitch ball to be counted as a strike it must pass over the strike zone. Where is the batter's strike zone?
 - A. Between the shoulders and ankles and over the home plate.
 - B. Between the neck and the top of the knees and over the home plate.
 - C. Between the armpits and the top of the knees and over the home plate.
 - D. Between the waist and the top of the knees and over the home plate.
11. A legally batted ball is said to be fair when it
 - A. settles in fair territory in the infield.
 - B. touches fair territory and rolls foul in the infield.
 - C. rolls outside third base into the outfield.
 - D. hits foul territory in the outfield and bounces fair.
12. A batter-runner successfully hit a fair ball and reaches first base. The next batter in the line-up hits a fly ball and was caught by a fielder. When does the base-runner advance to another base?
 - A. As soon as the ball is hit
 - B. As soon as the ball is caught
 - C. As soon as the ball leaves the pitcher's hand
 - D. The base runner may not advance to another base on a fly ball
13. The bases are loaded and the on-deck batter interferes with the defensive player's opportunity to make a play on the runner. Who is called out?
 - A. The batter
 - B. The runner on first
 - C. The runner on second
 - D. The runner on third
14. Softball is played in innings and run is the unit in scoring. What determines the winner of a game?
 - A. The team that scores five runs first
 - B. The team that makes the fewest errors
 - C. The team that has the most hits in a regulation game
 - D. The team that scores the most runs in a regulation game
15. The outfielders support the basemen in fielding balls. Which base is usually not backed up by the pitcher?
 - A. First base
 - B. Second base
 - C. Third base
 - D. Home
16. The bases are loaded with no outs. The batter swings and misses a third strike. How is the batter put out?
 - A. The catcher must hold the ball to put the batter out.
 - B. The catcher must tag the batter to make the out.
 - C. The catcher must throw to first to put the batter out.
 - D. The batter is automatically out.

17. What position in the serving order a player takes if he/she re-enters the game?
- A. His or her original position
 - B. The serving position
 - C. The left front position
 - D. Any position
18. A toss coin is performed by the first referee between the two team captains before the match. What choices does the winner of the toss coin have?
- A. First serve or team area in that game
 - B. First serve in the first or second game
 - C. First serve and team area in that game
 - D. First serve in the first and second game
19. A hit is any contact with the ball by a player in play. When may a player hit the ball twice in a row?
- A. Never
 - B. When the first hit was an attempted block
 - C. When the hits are made with different body parts
 - D. When the first hit was a ball recovered from the net
20. A back row player on the serving team spikes the ball into the opponent's court. The spike was behind the attack line when jumping to make the spike. What was the decision?
- A. Legal play
 - B. Point
 - C. Side-out
 - D. Replay
21. The service is the act of putting the ball in play. What is the most important aspect of the serve?
- A. The placement of the ball
 - B. The height of the ball
 - C. The speed of the ball
 - D. The spin on the ball
22. A block attempt is the action of blocking without touching the ball. If two or more players attempt to block a spike at the same time what is this called?
- A. A team block
 - B. An attack block
 - C. A multiple block
 - D. A simultaneous block
23. The officiating officials cause the game to progress with as little interference as possible. Which of these directs the match from the start until the end?
- A. Head official
 - B. First refereev
 - C. Umpire
 - D. Head Referee
24. A playing area does not have the required clearance above the court. A serve hits the ceiling. What is the ruling?
- A. Play continues
 - B. Reserve
 - C. Second serve
 - D. Side-out
25. A player is permitted to penetrate into the opponent's space under the net, provided that this does not interfere with the opponent's play. Which event is a center line violation?
- A. Stepping on the center line
 - B. Touching the opponent's playing area with the hands
 - C. Stepping on center line and opponent's playing area
 - D. Having one or both feet on or above the center line

PRE-BOARD EXAMINATION

1. A player makes a two-step stop after receiving a pass. What is the player permitted to do?
 - A. Pivot in any directions on the front foot.
 - B. Pivot in any directions on the back foot.
 - C. Pivot in any directions on either foot.
 - D. Pivot in any directions on both feet.
2. What is the purpose of arching shots toward the basket?
 - A. so the ball will go a longer distance
 - B. so the ball will be dropping into the basket
 - C. so there will be a less chance of a guard blocking the shot
 - D. so the players will have time to get into rebounding positions.
3. Where should the ball be in relation to the body when using a speed dribble?
 - A. in front
 - B. to the side when closely guarded
 - C. slightly toward the dribbling-hand side
 - D. in front and slightly toward the non dribbling-hand side
4. Where is the strike zone?
 - A. Between the shoulders and ankles and over the plate.
 - B. Between the neck and the top of the knees and over the plate.
 - C. Between the armpits and the top of the knees and over the plate.
 - D. Between the waist and the top of the knees and over the plate.
5. What is the most important thing to remember when catching a ball above the waist?
 - A. to catch with the gloved hand only
 - B. to wait for the ball to drop to waist level
 - C. to hold the hands out in front of the body
 - D. to keep the thumbs together and fingers pointed up
6. What position is best for fielding a ground ball?
 - A. side stride, one knee on the ground, glove waist high
 - B. forward stride, one knee on the ground, glove waist high
 - C. side stride, knees bent and hips lowered, glove touching the ground
 - D. forward stride, knees bent and hips lowered, glove touching the ground
7. Which parts of the hands supply the primary force in hitting an overhand pass?
 - A. the finger pads and thumbs
 - B. the finger pads of the last three fingers
 - C. the heels of the hands, finger pads, and thumbs
 - D. the thumbs and finger pads of the first two fingers
8. What movements contribute to the height of the jump in hitting a spike?
 - A. leg extension
 - B. arching of the back
 - C. upward movement of the arms
 - D. leg extension and upward movement of the arms
9. When should the blocker extend his or her arms upward for the block?
 - A. just before reaching the peak of the jump
 - B. as he or she jumps upward to block the ball
 - C. as the spiker begins the forward motion for the spike
 - D. as he or she moves into position to jump for the block
10. A player is blocking a spike. How far apart should the player's thumbs be?
 - A. 1 to 2 inches
 - B. 6 inches apart
 - C. touching each other
 - D. slightly less than the width of the ball apart

Personal, Community, Environmental Health, Safety Education and First Aid

Prepared by:
Prof. Minerva Y. Atanacio-Brillante

Competencies:

1. Apply learning relative to health education
 - Proper handling of the injured and victim of accidents
 - Diseases and drugs
 - Environmental issues and concerns
 - Personal care and hygiene

PART I - CONTENT UPDATE

PERSONAL HEALTH

PERSONAL CARE

Having healthy skin, hair, and nails is a part of looking and feeling your best. These are the first things people see when they look at you.

A. SKIN

MAIN LAYERS OF THE SKIN

1. **Epidermis** - the layer just below the skin's surface that continually produces new cells. These cells are nourished by the blood vessels that run through the skin. As cells are produced here, older cells are pushed to the surface. Since there are no blood vessels at the surface, the cells are deprived of nourishment and die.
2. **Dermis** - it contains muscle fibers, blood vessels, and nerves. The blood vessels bring nutrients to the skin, and carry away waste products. The nerves in the dermis help you sense your environment. They transmit messages of pain that warn you of possible danger of injury.

SKIN CARE

- A balanced diet, regular exercise, and sleep are essential for healthy skin.

BASIC STEP SKIN CARE

1. **Cleanse** - Soap should only touch your skin from the neck down. Do not cleanse too often.

2. **Exfoliate** - Scrubs work by removing the top layer of dead skin cells that tend to dull your complexion.
3. **Moisturize** - A basic rule of beauty is that if you have dry skin, you should invest in a basic moisturizer. But be careful not to over-moisturize for this can clog pores.
4. **Apply sunscreen** - The #1 cause of wrinkles is sun damage, so it's important to use a sunscreen of at least 30 SPF from your early years

B. HAIR

- Hair helps to insulate your body from the cold and the heat.
- Eyelashes and the hair in your nostrils and ears keep dust and dirt out of your eyes, nose and ears.
- Eyebrows help to keep sweat from running into your eyes.
- The hair on your arms and legs helps you sense when something is on or close to your skin.

HAIR CARE

- Frequent, gentle brushing helps to remove dirt and makes your hair shine
- Shampooing washes away built-up oil.

HAIR SPA Treatment

A hair spa involves oil massage of the scalp, shampooing and conditioning. It starts with oiling the scalp and the hair, which is followed by shampooing. After shampooing, conditioning treatment is done. It may take around one hour for this treatment at a salon. Hair spa treatment is said to be best for those, who are facing hair loss and those with dull and damaged hair. This treatment is claimed to arrest hair fall and regain the lost sheen and bounce of the hair. Even hair problems, like, dandruff, itchy scalp, etc., can be reduced with this treatment.

Scalp is massaged for at least 10 minutes during shampooing. After the shampoo, a deep conditioning mask is applied and it is massaged for 20 -25 minutes. Then a cream is applied from the root of the hair to the tip. The whole process takes almost 40-45 minutes.

HAIR CARE TIPS

General

- A healthy lifestyle will mean healthier hair for you. Excessive stress, smoking, not exercising and not eating nutritious foods are not healthy for your hair
- Get enough sleep

Hair product

- Avoid using hair styling products with alcohol which dries out hair.
- Avoid putting hair styling products directly on your scalp to avoid clogging of pores.

Swimming

- Wet your hair with tap water before entering the pool to soak up the initial water instead of the chlorinated water.
- When swimming wear a cap to protect your hair from chlorinated water
- If you choose not to wear a cap make sure you shampoo and condition your hair right after you are done swimming

Drying

- Hot air can damage your hair so use the cool setting
- Don't leave the blowdryer in one spot for more than a few seconds, keep it moving and at a good distance from your hair
- Gently use your finger or a pick to untangle knots while your hair is drying

Combing/ Brushing

- Avoid brushing hair when it's wet, or it will cause breakage. Wait until your

hair is almost dry.

- Use brushes/combs with widely spaced bristles/teeth and smooth tips. Sharp tooth combs can damage your hair, cause split ends and scratch your scalp.
- Begin by combing your hair gently at the ends to get any tangles out and work way up to the base of your hair.

Shampooing and Conditioning

- Buy shampoo & conditioners that match your hair type. Trial and error is the best way to find out what specific hair product is best for your hair.
- When shampooing, rinse your hair then apply shampoo into your scalp and massage it gently with your finger tips. Then thoroughly rinse out your hair to remove any shampoo residue
- Try rotating the shampoo and conditioner periodically, hair responds differently to different products
- Use a conditioner after shampooing; it gives extra protection, add shine, reduce static
- When conditioning your hair, try to spread conditioner evenly throughout your hair and leave it for a couple of minutes before rinsing out your hair.
- Put the conditioner in at about an inch away from the scalp, the roots of your hair contain the most oils and don't need the extra conditioning.

C. NAILS

- Fingernails and toenails, like your hair, are outgrowths of the skin that protect the sensitive upper surfaces of the tips of your fingers and toes.
- If your hands are in water frequently, your nails will become brittle.
- White spots on nails are the result of minor injuries.

NAIL CARE

- Brush regularly

- Clip or file so edges are smooth
- Some spas offer services aimed at improving your nails. Overlays, silk wraps and hardening treatments can strengthen your natural nails so you no longer need artificial nails.

NAIL TREATMENT

Nail treatments are some of the quickest and most cost-effective ways to pamper yourself such as manicure and pedicure.

D. EYES

THREE LAYERS OF THE EYES

SCLERA - the outside layer of our eye which is white. Muscles attached to it allow the eye to move within its socket

OPTIC NERVE - the nerve that transmit visual information to the brain.

CONJUNCTIVA - covers the front part of the sclera and the inside of the eyelid.

RETINA- light-sensing part of the eye.

EYE CARE

Avoid eye strain

Be sure to have adequate light when reading

Regular examination

Use protective glasses or goggles

E. EARS

PARTS of the EARS

OUTER EAR includes auricle, ear canal and eardrums

MIDDLE EAR contains three small bones- hammer, anvil and stirrup
INNER EAR structures in the inner ear help you maintain your balance.

Vestibule – fluid filled chamber that senses the position of your head
Semicircular canals- a set of three hollow tubes detects changes in body position

EAR CARE

Wet washcloth to clean your outer ear
Never insert a cotton-tipped swab into your ear canal to clean it.
Wear ear plug when swimming

D. TEETH

TYPES OF TEETH

INCISORS-teeth with sharp edges used to cut food
CANINES- teeth with single point that are used for tearing food
PREMOLARS- have flat surfaces with rounded ridges for crushing food
MOLARS-have large flat surface used to grind food

DENTAL CARE

Eat a balance diet low in sugar
Brushing teeth 3 x a day
See dentist regularly

HOW TO BRUSH TEETH

- Place toothpaste on your toothbrush
- Brush teeth for a full two minutes
- Hold the brush at a 45-degree angle against your teeth.
- Brush the outer and inner surface of teeth, the chewing surface of your gums
- Brush teeth after each meal.

HOW TO FLOSS

- Floss a minimum of once every day.
- Slide the floss between your teeth with a back and forth movement, not up and down. The floss should move against both teeth and go up to the gums.
- Floss between all teeth including the back teeth that are against gums.

COMMUNITY HEALTH

THE USE AND MISUSE, AND ABUSE OF DRUGS

DRUG - is any substance that causes a physical or emotional change in a person.

Categories of drugs:

1. **HERBAL DRUGS** - herbal drugs can be classified as drugs because they have an effect, though mild, on the body. Because they are mild, herbal drugs are not controlled by law.
2. **OVER-THE-COUNTER DRUGS** - can be legally bought without the doctor's prescription.
 - a. **ANALGESIC** - are used to relieve pain. Three kinds are aspirin, acetaminophen, and ibuprofen.
 - b. **SEDATIVES** - are drugs that slows down body functioning and make you sleepy.
 - c. **STIMULANTS** - are opposite of sedatives, they make you more alert. Commonly used stimulant is caffeine.
3. **PRESCRIPTION DRUGS** - are drugs that require a doctor's prescription. A prescription is a doctor's written order to a pharmacist that a patient is allowed to purchase a drug. A prescription drug includes the drug's name, direction for use and amount of drugs to be used.

4. TOBACCO PRODUCTS- it contains:

- a. **Tar** - solid material in tobacco smoke that condensed into a thick liquid. They are tiny particles that when they enter the lungs they condense and form a sticky coating on the bronchial tubes. It damages the tiny hairs in the tube and so they will not be able to protect him from getting a serious respiratory disease
- b. **Nicotine**- is the psychoactive chemical in tobacco. It causes a change in a person's mood and behavior. It is very addictive. A person who is addicted to nicotine has trouble functioning without it.
- c. **Carbon Monoxide**-an extremely dangerous gas released by burning cigarettes.

EFFECTS OF NICOTINE

BRAIN - smoking restricts oxygen flow and causes a narrowing of the blood vessels in the brain, which can lead to stroke

LUNGS - cigarette smoke introduces cancer-causing agents directly to the lung tissue. It also impairs the cilia's ability to clear these and other harmful foreign substances from the lungs.

HEART- nicotine increases heart rate and blood pressure, and constricts the blood vessels, which can lead to a heart attack.

RISK of "PASSIVE SMOKING"

- Mainstream smoke- passes through the tobacco and filter when the smokers inhale
- Side stream smoke- rises from the cigarette during the time the smoker is not inhaling. Almost 75% of the smoke that comes from a burning cigarette is side stream smoke.

ALCOHOL

- It irritates the throat and esophagus on its way into the stomach and into the intestine.
- From there alcohol is absorbed into the bloodstream going to all cells and tissues including the brain.
- About 20% of the alcohol is absorbed into the blood stream through the stomach wall.
- Alcohol remains in the blood stream until it can be metabolized by the liver.
- When ALCOHOL REACHES THE LIVER, IT BREAKS DOWN INTO CARBON DIOXIDE AND WATER. The more a person drinks, the harder his liver will work to get rid of the alcohol.

Three phases of addiction to alcohol:

1. **ABUSE**- when a person drinks alcohol he cannot do so in moderation or at appropriate times.
2. **DEPENDENT**- people in the dependent phase of alcoholism feel they need the drug to function properly. They have a very strong and constant desire for alcohol. Alcohol is beginning to dominate their lives.
3. **ADDICTION**- dependence on alcohol becomes physical or psychological. Being addicted means putting the drug before anything else. Sometimes they substitute alcohol for food which can lead to serious health problems such as malnutrition.

Long Term Effect

- **Hepatitis** - is an inflammation or infection of the liver that can cause fever, a yellowing of the skin, weakness and sometimes death.
- **Cirrhosis** - occurs when liver cells are permanently replaced with useless scar tissue. People with cirrhosis often suffer from serious digestive problems because their liver is no longer able to metabolize food properly.

- **Alcohol can damage the heart** . It causes fat deposits on heart muscles.
- Alcohol kills brain cells which cannot be replaced.
- Long term used can increase one's changes of suffering from cancer of the liver, esophagus, pharynx, and larynx.

ENVIRONMENTAL HEALTH

ENVIRONMENTAL HEALTH- Environmental health is the branch of public health that is concerned with all aspects of the natural and built environment that may affect human health.

THE ENVIRONMENT AND HEALTH

- **ECOSYSTEM** - a system made of living things and their physical surroundings. Every living thing is part of the ecosystem.
- **INTERACTIONS** - one characteristic of an ecosystem is that its living and non-living parts interact with each other.
- **INTERDEPENDENCY** - whatever happens to one part of the ecosystem affects other parts.
- **HOMEOSTASIS** - the tendency of any living thing to maintain a balance in its inner system.

ELEMENTS OF A HEALTHY ENVIRONMENT

- **WATER-** water is vital to all living things. Sixty five to seventy percent of our body is water and eighty percent of the brain. In addition we use water to drink and to use for personal and household cleanliness, food preparation and recreation.
- **AIR** – another substance that is vital to all living things. Oxygen allows us to obtain energy from food. Carbon dioxide traps the sun's heat and is used by plants to make food that animals need.

ENVIRONMENTAL POLLUTION

1. **WATER POLLUTION-** the contamination of water bodies (e.g. lakes, rivers, oceans and groundwater. Water pollution occurs when pollutants are discharged directly or indirectly into water bodies without adequate treatment to remove harmful compounds.

Diseases spread by water pollution

- Cholera
- Typhoid
- Cancer
- Birth defects
- Gastro-intestinal disorders
- Kidney and liver disorders

WATER POLLUTION CAUSES

The causes of water pollution vary and may be both natural and anthropogenic. However, the most common causes of water pollution are the anthropogenic ones including:

1. **Agriculture runoff** – carrying fertilizers, pesticides/insecticides/herbicides and other pollutants into water bodies such as lakes, rivers, ponds). The usual effect of this type of pollution consists in algae growing in affected water bodies. This is a sign of increased nitrates and phosphates in water that could be harmful for human health.
2. **Mining activities** – mining activities involve crushing the rock that usually contains many trace metals and sulfides. The left material may easily generate sulfuric acid in the presence of precipitation water.
3. **Accidental leaks and spills** – associated with handling and storage of chemicals may happen anytime and, although they are usually contained

soon after they occur, the risk of polluting surface and groundwater exist. An example are ship accidents such as Exxon Valdez disaster which spilled large amounts of petroleum products into the ocean.

4. **Intended/illegal discharges of waste** while such occurrences are less common today, they may still happen due to the high cost of proper waste disposal; illegal waste discharges into water bodies were recorded all over the world.
5. **Burning of fossil fuels** – the emitted ash particles usually contain toxic metals (such as As or Pb). Burning will also add a series of oxides including carbon dioxide to air and respectively water bodies.
6. **Disposal of personal care products and household chemicals (including detergents and various cleaning solutions)** – this is a serious problem since the releases to water are unpredictable and hard if not impossible to control. It is up to each of us to minimize this contribution to water pollution by controlling our consumption and disposal of such products as well as trying to recycle as much as we can.

EFFECTS of Water Pollution

Water pollution affects plants and organisms living in these bodies of water in almost all cases. The effect is damaging not only to individual species and populations but also to the natural biological communities. Water pollution is harmful to the health of humans and animals. Water pollution may not damage our health immediately but can be harmful after long term exposure. Different forms of pollutants affect the health of animals in different ways:

- Heavy metals from industrial processes can accumulate in nearby lakes and rivers. These are toxic to marine life such as fish and shellfish, and subsequently to the humans who eat them. Heavy metals can slow development; result in birth defects and some are carcinogenic.

- Industrial waste often contains many toxic compounds that damage the health of aquatic animals and those who eat them. Some of the toxins in industrial waste may only have a mild effect whereas other can be fatal. They can cause immune suppression, reproductive failure or acute poisoning.
- Microbial pollutants from sewage often result in infectious diseases that infect aquatic life and terrestrial life through drinking water. Microbial water pollution is a major problem in the developing world, with diseases such as cholera and typhoid fever being the primary cause of infant mortality.
- Organic matter and nutrients causes an increase in aerobic algae and depletes oxygen from the water column. This causes the suffocation of fish and other aquatic organisms.
- Sulfate particles from acid rain can cause harm the health of marine life in the rivers and lakes it contaminates, and can result in mortality.
- Suspended particles in freshwater reduces the quality of drinking water for humans and the aquatic environment for marine life. Suspended particles can often reduce the amount of sunlight penetrating the water, disrupting the growth of photosynthetic plants and micro-organisms.

Harmful Effects of Water Pollution

- A number of waterborne diseases are produced by the pathogens present in polluted water, affecting humans and animals alike.
- Pollution affects the chemistry of water. The pollutants, including toxic chemicals, can alter the acidity, conductivity and temperature of water.
- Polluted municipal water supplies are found to pose a threat to the health of people using them.
- As per the records, about 14000 people perish or incur various communi-

cable diseases due to the consumption of contaminated drinking water.

- The concentration of bacteria and viruses in polluted water causes increase in solids suspended in the water body, which, in turn, leads to health problems.
- Marine life becomes deteriorated due to water pollution. Lethal killing of fish and aquatic plants in rivers, oceans and seas is an aftereffect of water contamination only.
- Diseases affecting the heart, poor circulation of blood and the nervous system and ailments like skin lesion, cholera and diarrhea are often linked to the harmful effects of water pollution.
- Carcinogenic pollutants found in polluted water might cause cancer.
- Alteration in the chromosomal makeup of the future generation is foreseen, as a result of water pollution.
- Discharges from power stations reduce the availability of oxygen in the water body, in which they are dumped.
- The flora and fauna of rivers, sea and oceans is adversely affected by water pollution.

2. **AIR POLLUTION** - is caused by the release of toxic gases and particles into the atmosphere by automobiles, factories, power generating plants and burning trash. These pollutants can be carried long distance by the wind or can rise up to the upper levels of the atmosphere where they can cause major worldwide problems.

Destruction of the OZONE layer. Ozone layer completely surrounds the planet and protects living things from the ultra violet rays of the sun.

Global warming and the Green House Effect. The green house effect is

used to describe the warming effect of certain gases in the atmosphere that trap heat from the sun's rays.

- Carbon dioxide
- Water vapor
- Methane
- Ozone
- Nitrous oxide
- CFC's

Agricultural and Industrial consumer practices are increasing the amount of green house gases in the atmosphere. At the same time trees which consume carbon dioxide and give off oxygen, the overall effect of these changes is what we call global warming.

Indoor Air Pollution - Indoor air pollutants in tightly sealed buildings may be more

- Asthma
- Bronchitis
- Heart disease
- Emphysema

3. **LAND POLLUTION** - is the spoiling of the land so that it is unfit to be inhabited by living things. But the greatest land pollution problem is the accumulation of wastes that are produced and discarded by humans.

- a. **SOLID WASTE**

The most common of dealing with solid waste has been to dump them "as far as possible. But these are breeding grounds for disease-carrying insects and rodents.

Most solid waste is now placed in sanitary landfills. At these sites, the

waste are covered with a layer of spoil to prevent the spread of disease.

EFFECTS:

- When covered with soil, some materials often escape from landfills to pollute the air and water
- When burned, it reduces the amount of solid waste because they may cause injury, illness or death.

b. HAZARDOUS WASTE

Certain types of wastes are classified as hazardous waste because they may cause injury, illness or death.

- Heavy metals such as lead, and mercury are toxic and may block the digestive system causing starvation or even death.
- Nuclear waste-exposure to a large dose of radiation from nuclear wastes can be deadly. It can cause bone marrow damage, skeletal abnormalities, cataract as well as leukemia and other types of cancer.

4. NOISE POLLUTION - Loud or constant noise not only can damage your hearing but also can cause:

1. Fatigue, Stress, Irritability, Anger, Tension, Anxiety
 2. Prolong exposure can rupture eardrums and may cause permanent hearing loss.
- The slightest sound that the human ear can detect has a loudness of 0 decibels (dB)
 - Sound in the 40-60 dB range are comfortable
 - Constant exposure to 70 dB can be annoying and may begin to damage your hearing
 - Exposure to sounds to 120 dB may result to serious damage.

- Sounds of 140 or more can cause pain
- At 180 dB, irreversible hear loss may occur.

PROTECTING NATURAL RESOURCES AND THE ENVIRONMENT

CONSERVATION - is the protection and wise use of natural resources by using less of the materials we take from the environment, particularly those resources that are nonrenewable. It also means protecting the environment from pollutants by using products that are less toxic.

RECYCLING AND REUSING - Many of the materials that we discard can be reused.

Ways or reusing materials:

- **Recycling**- the reusing of materials either directly or indirectly by making them into another products.
- **Composting**- the conversion of organic matter into fertilizer by allowing it to be broken down by the action of bacteria.
- **Pulverizing and Compacting**- the pounding of solid wastes into bricks that can be used in constructing landfills, roads and other structures.

REDUCING PERSONAL POLLUTION

1. Preserving the Air:

- Walk, bicycle or carpool
- Purchase safer alternatives to products sold in aerosol cans.
- Choose not to smoke or spend time with those who do.
- Keep the car well tuned, & have the exhaust system checked frequently
- Avoid purchasing products that contains formaldehyde or CFCs
- Use less electricity
- Plant trees

2. Preserving the water

- Use only biodegradable, low-phosphate detergents.
- Fix leaks faucets and toilets quickly
- Take shorter shower.

3. Reducing Solid and Chemical Waste

- Recycle and reuse whenever as possible
- Reduce household trash by purchasing reusable items and products with minimal packaging
- Start a compost pile for biodegradable garbage
- Limit the use of chemical fertilizers and pesticides
- Purchase environmental safe cleaning products.

Environmental issues in the Philippines

- The Philippines are prone to natural disasters, particularly typhoons, floods, landslides, volcanic eruptions, earthquakes, lying as it does astride the typhoon belt, in the active volcanic region known as the "PACIFIC RING OF FIRE" and in the geologically unstable region between the Pacific and Eurasian tectonic plates.
- the Philippines also suffers major human-caused environmental degradation aggravated by a high annual population growth rate, including loss of agricultural lands, deforestation, soil erosion, air and water pollution, improper disposal of solid and toxic wastes, loss of coral reefs, mismanagement and abuse of coastal resources, and overfishing.
- According to Greenpeace SouthEast Asia, the Philippines major historical river, the Pasig River is now biologically dead due to negligence and industrialization. Currently, the Philippines' Department of Environment and

Natural Resources has been busy tracking down illegal loggers and been spearheading projects to preserve the quality of many remaining rivers that are not yet polluted.

Anti- Nuclear movement in the Philippines

- The anti- nuclear movement in the Philippines aimed to stop the construction of nuclear power facilities and terminate the presence of American military bases, which were believed to house nuclear weapons on Philippine soil.
- Anti-nuclear demonstrations were led by groups such as the Nuclear-Free Philippines Coalition and No Nukes Philippines.
- A focal point for protests in the late 1970s and 1980s was the proposed Bataan Nuclear Power Plant, which was built but never operated. The project was criticised for being a potential threat to public health, especially since the plant was located in an earthquake zone.
- The demand of the anti-nuclear movement for the removal of military bases culminated in a 1991 Philippine Senate decision to stop extending the tenure of US facilities in the Philippines. Tons of toxic wastes were left behind after the US withdrawal and anti-nuclear and other groups worked to provide assistance for the bases' cleanup.

AIR

Air pollution - is the introduction of chemicals, particulate matter, or biological materials that cause harm or discomfort to humans or other living organisms, or damages the natural environment into the atmosphere.

The atmosphere is a complex dynamic natural gaseous system that is essential to support life on planet Earth. Stratospheric ozone depletion due to air pollution has

long been recognized as a threat to human health as well as to the Earth's ecosystems.

Indoor air pollution and urban air quality are listed as two of the world's worst pollution problems in the 2008 up to now.

- Greenhouse gases have already reached dangerous tipping point. The total "long-term" carbon dioxide equivalent of greenhouse gases in the atmosphere has already reached 455 parts per million. (Intergovernmental Panel on Climate Change Report) This level is considered a tipping point.
- "The amount of greenhouse gas in the atmosphere is already above the threshold that can potentially cause dangerous climate change. We are already at risk...It's not next year or next decade, it's now." (Tim Flannery, climate change expert)
- The research shows carbon emissions have grown sharply since 2000, despite growing concerns about climate change. During the 1990s, carbon emissions grew by less than 1% per year. Since 2000, emissions have grown at a rate of 3.5% per year. No part of the world had a decline in emissions from 2000 to 2008.
- Climate disasters are on the rise. Around 70 percent of disasters are now climate related – up from around 50 percent from two decades ago.
- These disasters take a heavier human toll and come with a higher price tag. In the last decade, 2.4 billion people were affected by climate related disasters, compared to 1.7 billion in the previous decade. The cost of responding to disasters has risen tenfold between 1992 and 2008.
- Destructive sudden heavy rains, intense tropical storms, repeated flooding and droughts are likely to increase, as will the vulnerability of local communities in the absence of strong concerted action.
- Unless we can reduce the amount of carbon dioxide in the atmosphere to 350 parts per million, we will cause huge and irreversible damage to the earth.

Pollutants

Schematic drawing, causes and effects of air pollution: (1) greenhouse effect, (2) particulate contamination, (3) increased UV radiation, (4) acid rain, (5) increased ozone concentration, (6) increased levels of nitrogen oxides

An air pollutant is known as a substance in the air that can cause harm to humans and the environment. Pollutants can be in the form of solid particles, liquid droplets, or gases. In addition, they may be natural or man-made.

Pollutants can be classified as either primary or secondary. Usually, primary pollutants are substances directly emitted from a process, such as ash from a volcanic eruption, the carbon monoxide gas from a motor vehicle exhaust or sulfur dioxide released from factories.

Secondary pollutants are not emitted directly. Rather, they form in the air when primary pollutants react or interact. An important example of a secondary pollutant is ground level ozone — one of the many secondary pollutants that make up photochemical smog.

Major primary pollutants produced by human activity include:

- **Sulfur oxides (SO_x)** - especially sulfur dioxide, a chemical compound with the formula SO₂. SO₂ is produced by volcanoes and in various industrial processes. Since coal and petroleum often contain sulfur compounds, their combustion generates sulfur dioxide. Further oxidation of SO₂, usually in the presence of a catalyst such as NO₂, forms H₂SO₄, and thus acid rain.[2] This is one of the causes for concern over the environmental impact of the use of these fuels as power sources. Nitrogen oxides (NO_x) - especially nitrogen dioxide are emitted from high temperature combustion. Can be seen as the brown haze dome above or plume downwind of cities. Nitrogen dioxide is the chemical compound with the formula NO₂. It is one of the several nitrogen oxides. This reddish-brown toxic gas has a characteristic sharp, biting odor. NO₂ is one of the most prominent air pollutants
- **Carbon monoxide** - is a colourless, odourless, non-irritating but very poisonous gas. It is a product by incomplete combustion of fuel such as natural gas, coal or wood. Vehicular exhaust is a major source of carbon monoxide.
- **Carbon dioxide (CO₂)** - a greenhouse gas emitted from combustion but is also a gas vital to living organisms. It is a natural gas in the atmosphere.
- **Volatile organic compounds** - VOCs are an important outdoor air pollutant. In this field they are often divided into the separate categories of methane (CH₄) and non-methane (NMVOCs). Methane is an extremely efficient greenhouse gas which contributes to enhanced global warming. Other hydrocarbon VOCs are also significant greenhouse gases via their role in creating ozone and in prolonging the life of methane in the atmosphere, although the effect varies depending on local air quality. Within the NMVOCs, the aromatic compounds benzene, toluene and xylene are suspected carcinogens and may lead to leukemia through prolonged exposure. 1,3-butadiene is another dangerous compound which is often associated with industrial uses.

- **Particulate matter** - Particulates, alternatively referred to as particulate matter (PM) or fine particles, are tiny particles of solid or liquid suspended in a gas. In contrast, aerosol refers to particles and the gas together. Sources of particulate matter can be man made or natural. Some particulates occur naturally, originating from volcanoes, dust storms, forest and grassland fires, living vegetation, and sea spray. Human activities, such as the burning of fossil fuels in vehicles, power plants and various industrial processes also generate significant amounts of aerosols. Averaged over the globe, anthropogenic aerosols—those made by human activities—currently account for about 10 percent of the total amount of aerosols in our atmosphere. Increased levels of fine particles in the air are linked to health hazards such as heart disease,[3] altered lung function and lung cancer.
- Toxic metals, such as lead, cadmium and copper.
- **Chlorofluorocarbons (CFCs)** - harmful to the ozone layer emitted from products currently banned from use.
- **Ammonia (NH₃)** - emitted from agricultural processes. Ammonia is a compound with the formula NH₃. It is normally encountered as a gas with a characteristic pungent odor. Ammonia contributes significantly to the nutritional needs of terrestrial organisms by serving as a precursor to food stuffs and fertilizers. Ammonia, either directly or indirectly, is also a building block for the synthesis of many pharmaceuticals. Although in wide use, ammonia is both caustic and hazardous.
- **Odors** — such as from garbage, sewage, and industrial processes
- **Radioactive pollutants** - produced by nuclear explosions, war explosives, and natural processes such as the radioactive decay of radon.

Secondary pollutants include:

- Particulate matter formed from gaseous primary pollutants and compounds

in photochemical smog. Smog is a kind of air pollution; the word “smog” is a portmanteau of smoke and fog. Classic smog results from large amounts of coal burning in an area caused by a mixture of smoke and sulfur dioxide. Modern smog does not usually come from coal but from vehicular and industrial emissions that are acted on in the atmosphere by sunlight to form secondary pollutants that also combine with the primary emissions to form photochemical smog.

- Ground level ozone (O₃) formed from NO_x and VOCs. Ozone (O₃) is a key constituent of the troposphere (it is also an important constituent of certain regions of the stratosphere commonly known as the Ozone layer). Photochemical and chemical reactions involving it drive many of the chemical processes that occur in the atmosphere by day and by night. At abnormally high concentrations brought about by human activities (largely the combustion of fossil fuel), it is a pollutant, and a constituent of smog.
- Peroxyacetyl nitrate (PAN) - similarly formed from NO_x and VOCs.

Minor air pollutants include:

- A. Anthropogenic sources (human activity) mostly related to burning different kinds of fuel
 - “Stationary Sources” include smoke stacks of power plants, manufacturing facilities (factories) and waste incinerators, as well as furnaces and other types of fuel-burning heating devices
 - “Mobile Sources” include motor vehicles, marine vessels, aircraft and the effect of sound etc.
 - Chemicals, dust and controlled burn practices in agriculture and forestry management. Controlled or prescribed burning is a technique some times used in forest management, farming, prairie restoration or greenhouse gas abatement. Fire is a natural part of both forest and grassland

ecology and controlled fire can be a tool for foresters. Controlled burning stimulates the germination of some desirable forest trees, thus renewing the forest.

- Fumes from paint, hair spray, varnish, aerosol sprays and other solvents
- Waste deposition in landfills, which generate methane. Methane is not toxic; however, it is highly flammable and may form explosive mixtures with air. Methane is also an asphyxiant and may displace oxygen in an enclosed space. Asphyxia or suffocation may result if the oxygen concentration is reduced to below 19.5% by displacement
- Military, such as nuclear weapons, toxic gases, germ warfare & rocketry

B. Natural sources

- Dust from natural sources, usually large areas of land with little or no vegetation.
- Methane, emitted by the digestion of food by animals, for ex. cattle.
- Radon gas from radioactive decay within the Earth’s crust. Radon is a colorless, odorless, naturally occurring, radioactive noble gas that is formed from the decay of radium. It is considered to be a health hazard. Radon gas from natural sources can accumulate in buildings, especially in confined areas such as the basement and it is the second most frequent cause of lung cancer, after cigarette smoking.
- Smoke and carbon monoxide from wildfires.
- Volcanic activity, which produce sulfur, chlorine, and ash particulates.

Health effects

The World Health Organization states that 2.4 million people die each year from causes directly attributable to air pollution, with 1.5 million of these deaths attrib-

utable to indoor air pollution. has shown a strong correlation between pneumonia related deaths and air pollution from motor

Acid rain

Acid rain is a rain or any other form of precipitation that is unusually acidic, i.e. elevated levels of hydrogen ions (low pH). It can have harmful effects on plants, aquatic animals, and infrastructure through the process of wet deposition. Acid rain is caused by emissions of compounds of ammonium, carbon, nitrogen, and sulfur which react with the water molecules in the atmosphere to produce acids. Governments have made efforts since the 1970s to reduce the production of sulfur dioxide into the atmosphere with positive results. However, it can also be caused naturally by the splitting of nitrogen compounds by the energy produced by lightning strikes, or the release of sulfur dioxide into the atmosphere by volcano eruptions.

SAFETY EDUCATION AND FIRST AID

SAFETY EDUCATION is recognizing the risks or hazards and practicing behavior that promotes safety.

SAFETY – the condition of being protected against physical, social, spiritual, financial, political, emotional, occupational, psychological, educational or other types or consequences of failure, damage, harm or any other event which could be considered non-desirable.

WHY SOME PEOPLE LACK SAFETY AWARENESS?

- Ignorance and lack of caution – which can lead to death
- Use of alcohol and other drugs- it increases risk behavior and carelessness
- A person's emotional state- example: an angry person is likely to act on impulse and with little or no regard for what might happen
- Peer pressure can influence individuals to take unnecessary risks

FACTORS THAT HELP PREVENT ACCIDENTS

- Knowledge and awareness- Becoming aware of the different dangers at home, on the streets, at work or in any place and knowing what action to take to help reduce the risk of injury.
- Ability- A person who is equipped with appropriate skills in doing a certain activity keeps him from accidents.
- State of Mind- A person, who is tired, distressed or under the influence of drugs is more likely to be injured or may cause injury to others. So by being alert and ready in all situations a person can keep himself away from meeting accidents.
- Environmental Conditions- Identify any possible source of harm in the environment. A safe physical condition of the environment can keep a person from harm.

CLASSIFICATIONS OF ACCIDENTS	PREVENTIONS
1. VEHICULAR ACCIDENTS	- Obey traffic signs - Use safety belt always - Never drive under the influence of drugs or liquor - Never drive when sleepy - Don't tailgate - Wear corrective eyeglasses when necessary
2. ACCIDENTS AT HOME	- Electrical wiring must be checked regularly - Sharp tools and poisonous products should be kept away from children - Handrails should be sturdy and step non-slip - Floors and stairs should be free of materials that may cause accidents - Always keep the floor dry
3. EARTHQUAKES	- If outdoors, get away from building and other tall objects - If inside the car, pull over but stay inside the car - If indoors, stand in a doorway or get under a heavy table. Stay away from windows and door with glass panels
4. ASSAULTS	- When at home, keep door locked. Never unlock a door for strangers - Never let strangers know that you are alone - Avoid deserted area, alleys and poorly lighted parks when walking at night. - Keep the doors locked when inside a car - If you are attacked let good judgment determine your action, escape if you can.

FIRST AID

First Aid is the immediate care given until professional medical personnel arrive at the scene of an accident or sudden illness.

FIRST STEPS IN EMERGENCY

1. **SURVEY THE SCENE** - evaluate the situation and the area for possible danger to you or to the victim. Determine what happened and how many people were injured. Look for bystanders who can help you.
2. **RESCUE** - next step is to rescue anyone whose life is in danger. Otherwise, never moved an injured person until medical help arrives. Moving someone who has a head, neck or spine injury could cause further serious or fatal injury.
3. **SEND FOR MEDICAL HELP** - Ask for help. Do not leave the injured person until you have checked for a life- threatening conditions.

INITIAL ASSESSMENT PRIORITIES

1. Determine whether the victim is conscious or unconscious
2. Check ABC's (Airway, Breathing, Circulation of the blood)
3. Cardiopulmonary Resuscitation (CPR)- a lifesaving procedure designed to revive a person who is not breathing and has no heartbeat. At this stage the person is **TECHNICALLY DEAD**.
4. Control Bleeding- If breathing and circulation is adequate, the next priority is to stop severe bleeding that is life threatening.
 - a. Direct pressure

- b. Elevation
 - c. Tourniquet
5. Treat Poisoning- as soon as the victim's ABC's are in order and bleeding stopped, the next to be treated is poisoning.

WOUNDS

OPEN WOUNDS	FIRST AID
1. Laceration-the skin is torn. It usually bleeds freely and risk of infection is small if the wound is kept clean.	• Stop severe bleeding • Wash with soap and water
2. Incision- clean cut, as made by a knife or sharp piece of glass.	• Cover with clean sterile dressing
3. Abrasion- skin is sapped or torn. A skinned knee from falling off a bicycle is an example	• Rinse carefully under running water • If dirt or other matter is stuck in the abrasion, try to remove larger pieces by wiping very gently with a clean, damp cloth or tissue. • Cover with bandage
4. Puncture- a hole through the skin and into the deeper tissue. They seldom bleed and risk of infection is greater than with other kinds of wounds.	• Encourage the wound to bleed, to help it clean • Wash the area around the wound to prevent infection • Have an up-to-date tetanus shots

OPEN WOUNDS	FIRST AID
5. Avulsion- skin or another part or the body is torn off, or nearly torn off and attached by a flap of skin.	• Use direct pressure on the wound to stop bleeding • If a flap of skin is cut off or hanging loose, gently lay it back in place before bandaging the wound. • If the body part has been removed, send it to the hospital with the victim. • Treat for shock.

PART II – ANALYZING TEST ITEMS

1. There are several reasons why a person becomes drug dependent or Drug Abuser. Who can help him/her best to get freed from his dependency?
- A. Family and friends
 - B. Institutions who cater for this group of people
 - C. Self
 - D. Government

The correct answer is **C**.

Although harmonious relationship among family members and friends are needed to avoid drug addiction, it is the person's responsibility to get out of such mess he went into. It is his responsibility

2. There are several ways to prevent from drug addiction. Which of these is the best way to be free from being hooked to drugs?
- A. Believe and trust yourself
 - B. Have a healthy lifestyle
 - C. Be friendly and go out with friends
 - D. Isolate yourself from the crowd

The correct answer is **B**.

Having healthy attitude towards self and others help an individual to be contented and to live a happy life. A contented person will live a healthful lifestyle and who need drugs after all?

3. Which of the following is not an advantage of the availability of over-the-counter drug?
- A. Self-administered treatment
 - B. Feed physician from serving people whose illnesses are worst than them

- C. People engaged in self-diagnosis
- D. Determined a course for their own treatment

The correct answer is **A**.

It is advisable to always consult specialists. Self-medication might pose more problems

4. Which of the following has pollution the greatest effect?
- A. Economic and social planning
 - B. People's physical health
 - C. Values
 - D. Technological innovations

The correct answer is **B**.

All living things are affected by the harmful effects of type of pollution.

5. Hair is as important as the rest of the body parts. Which of the following is not a good reason of why we need to give importance to our hair?
- A. It helps insulate our body from cold and heat
 - B. Keep dust and dirt out of our eyes, nose and ears
 - C. Help sweat from running into our eyes
 - D. They are made of dead a cell that needs to be nourished.
6. Labels can help consumer compare and evaluate health products especially on drugs because_____.
- A. Tells about the side effects
 - B. It gives the price
 - C. Tells about the ingredients
 - D. It includes expiration dates

7. The danger of burns depend on _____.
 - A. Depth , size and location
 - B. Size, location but not depth
 - C. Depth and location only
 - D. Depth, size but not location
8. Water is vital to all living things. What is the percentage of water in our body?
 - A. 65 to 70%
 - B. 75% to 100%
 - C. 55% to 65%
 - D. It depends on the size and age of a person
9. If you are caught in an open area during lightning, lying down on a dry land is the best way to avoid accident. Which of these is not the reason of such decision?
 - A. Water is a conductor of electricity
 - B. The tallest building is often hit by lightning
 - C. Those inside the building are often struck by lightning
 - D. Tall and isolated trees are commonly hit by lightning
10. A victim of car accident has pain in his neck. Upon checking, you found out the neck is swollen and tender. What should you do?
 - A. Ask the patient to remain quite and not to move
 - B. Splint the neck
 - C. Ask the patient to bend his head from side to side
 - D. Ignore it and tell the patient, it is nothing
11. Which of the following is not an effect of changes in the atmosphere?
 - A. Agriculture and industrial consumer practices
 - B. Cutting of trees which consume carbon dioxide
 - C. Water pollution
 - D. Noise pollution
12. Drug is considered a friend because _____.
 - A. It treats anxiety and tensions
 - B. Of its overall medical importance
 - C. It is used as anesthetics for surgical procedures
 - D. It treats different diseases
13. There are four critical areas of the body. What are they?
 - A. Face, feet, hands and genitals
 - B. Torso, genitals, feet and legs
 - C. Hands, feet, arms and legs
 - D. Head, chest, hand and genitals
14. During earthquakes one has to observe the following except:
 - A. If outdoor get away from buildings
 - B. Get out of the car and run inside a building for safety
 - C. If indoors stand in a doorway
 - D. If swimming out in the sea, get to the shore as fast as possible
15. A conscious victim has broken leg and blood is gushing from a big cut on the arm. What would you do first?
 - A. Splint the leg
 - B. Stop the bleeding
 - C. Check the breathing
 - D. Raise his arm
16. Wrong use of drugs can cause great harm to our body. Which of the following should we practice to get the full benefit from drug?
 - A. Illegal use of drug
 - B. Taking drugs for a different purpose
 - C. Following the correct dosage
 - D. Taking a substance for its intended use but not in appropriate amount

17. Certain types of wastes are classified as hazardous wastes, which of these has the greatest hazardous effect on mankind?
- Lead and mercury
 - Nuclear waste
 - Garbage
 - Chemical waste
18. One of the following is not a common reason why people lack safety awareness, what is it?
- Ignorance and lack of caution
 - Education
 - Person's emotional state
 - Peer pressure
19. Checking the victim's breathing is important. This is because
- A few minutes without oxygen can cause brain damage
 - An aider needs to decide if the patient needs CPR
 - To find out if the patient is still alive
 - Anything that blocks the victim's mouth or throat should be removed
20. Problems such as tooth decay can be prevented by the following
- Eat a balance diet low in sugar
 - Brushing teeth thrice a day
 - See dentist regularly
 - Eat sweet foods and high in cholesterol
21. There are different ways to stop bleeding but what among the following is the best first aid to simple cuts?
- Tourniquet
 - Direct pressure
 - Inhalation
 - None of these
22. An accident is an event that cannot be predicted. Which of these is not an element that characterized accidents?
- Accidents can make us rich because of insurance
 - Accidents may result to damage to properties
 - Accidents may result to unsuccessful performance
 - Accidents may happen anytime to anyone
23. The following are first aid treatment for Open Wound. Which of these is to be avoided?
- Clean wound with soap and water
 - Use hydrogen peroxide to clean the wound
 - Clean out all the dirt
 - Apply any ointment even if the wound has not been cleaned yet
24. You have been advised to take antibiotics for your skin disease. But because you are so busy you forgot to take one after lunch. What would you do?
- Take one right away and adjust the frequency of medicine intake
 - Shift to a much higher milligram
 - Double the dosage in the evening
 - Discontinue taking the pills
25. There are different ways of reducing personal pollution. What among the following is not recommendable?
- Preserving the air
 - Preserving the water
 - Reducing solid and chemical waste
 - Depend on the program of different health organization

PART III – ENHANCING TEST TAKING SKILLS

1. This is the first thing to do in an emergency
 - A. Rescue the victim
 - B. Check victims breaths
 - C. Give CPR
 - D. Treat wounds
2. Heart attack involves a clot in one of the blood vessels that supply the heart. What of the following should be avoided
 - A. Remove the victim from the source of heat
 - B. Open the airways
 - C. Cool the patient by means of cold water bath or cold moist towel
 - D. Watch out for convulsions or vomiting
3. IT is a drug primarily employed in surgery on the membranes lining the nose and throat.
 - A. Shabu
 - B. Cocaine
 - C. Barbiturates
 - D. Amphetamines
4. Second degree burns has _____
 - A. Open tissues
 - B. Few or no blisters
 - C. Black painful blisters
 - D. Red blisters
5. What is the most common reason why people turn to drugs?
 - A. Forced by parents
 - B. Curiosity
 - C. Necessity
 - D. Drugs are available
6. It is the branch of public health that is concerned with all aspects of the natural and environment that may affect human health.
 - A. Safety Education
 - B. Environmental Health
 - C. Community Health
 - D. Environmental Pollution
7. AN old woman is unable to move one side of her body, her speech is hard to understand. She might be suffering from _____
 - A. Heat stroke
 - B. A stroke
 - C. Heat exhaustion
 - D. Heart attack
8. It slows down the brain function and other parts of the nervous system
 - A. Chocolate
 - B. Alcohol
 - C. Coffee
 - D. Tea
9. It is prescribed to control extreme pain
 - A. Sedative
 - B. Antibiotic
 - C. Morphine
 - D. Opium
10. This is a simple scrape-type wounds which can be contaminated and infected due to dirt and bacteria
 - A. Laceration
 - B. Punctured
 - C. Incision
 - D. Abrasion
11. What drugs increase heart rate, blood pressure and breathing rate?
 - A. Inhalants
 - B. Hallucinogens
 - C. Depressants
 - D. Stimulants
12. First degree burns could be treated first by _____
 - A. Ordinary water sprinkle
 - B. Pouring oil on the affected area
 - C. Application of burn ointment
 - D. Pouring cold water on the burn

13. How does first aider check breathing of victims?
A. check the pulse at the neck C. ask the patients
B. check the eyes D. Listen at his breathing
14. Prevention of drug addiction is the responsibility of
A. Parents C. Self
B. Government D. None of these
5. In hair spa treatment, scalp is massaged for at least 10 minutes after shampooing. After the shampoo, a deep conditioning mask is applied and it should be massaged for:
A. 10- 15 minutes C. 15-20 minutes
B. 20-25 minutes D. 20-30 minutes
16. This is a simple scrape type which can be contaminated and infected due to dirt and bacteria
A. Laceration C. Incision
B. Puncture D. Abrasion
17. What drugs are used to treat people who have trouble sleeping?
A. Sedative C. Tranquilizer
B. Alcohol D. Antibiotics
18. A person with symptoms such as fever with chills, muscle aches, nasal congestion and sore throat is suffering from:
A. Pneumonia C. Typhoid
B. Common colds D. Bronchitis
19. What will you check after you rescue a little girl from the bottom of a pool?
A. Breathing C. Broken bones
B. Pulse D. Head injury
20. The protection & wise use of natural resources by using less of the materials we take from the environment.
A. Recycling C. Conservation
B. Reducing D. Re-using
21. An injury in which the end of the bone comes out of its joint, swollen and deformed is called_____.
A. Sprain C. Dislocation
B. Strain D. Fracture
22. To lessen assaults, the following should be observed except:
A. Tell a stranger that you are alone that is why you cant entertain them
B. Keep door locked
C. Walk with friends and avoid deserted areas
D. Do not bring valuable if alone
23. The following are signs for shocks except:
A. Rapid, shallow breath C. Blue lips
B. Pinkish skin D. Nausea and weaknesses
24. Healthy skin is one of the things people see when they look at you. What are essentials for healthy skin?
A. A regular body scrub
B. Taking vitamins needed for healthy skin
C. A balanced diet, regular exercise and sleep
D. Bathing regularly and applying lotion
25. A stretched or torn muscles or tendons is called_____
A. Strain C. Fracture
B. Sprain D. Dislocation

Philippine Folk and Ethnic Dances

Prepared by:
Prof. Lordinio A. Vergara

Competencies:

1. Identify the fundamentals of folk dance
 - Dance Terms
 - Dance Steps
 - Historical and Sociological Context

PART I - CONTENT UPDATE

A. Basic Concept of Folk Dance

- **Folk dancing** is the oldest form of dance probably one of the earliest forms of communication. It is this self-expression that separates folk dancing from the functional aspects of games and gymnastics in the physical education program.
- **Dance** is the expression of oneself through rhythmic movement. Folk dance, which is also the expression of oneself, is an expression through patterned movements. It is this patterning that traditionally separates folk dance forms from other dance forms. It is probably this characteristic of folk dance that has turned many youngsters off to dance – their inability to perform a set of patterned movements.
- Folk dance may be defined as the traditional dance of a given country which evolved naturally and spontaneously with everyday activities, e.g. occupations, customs, festivals, rituals, and innumerable themes common to all people everywhere. Genuine folk dances are handed down from generation to generation and are danced by everyday folk of all ages. They are more or less fixed in their pattern, but may differ in various areas of provinces.

B. PHILIPPINE FOLK AND ETHNIC DANCES

Five Major Classifications of Philippine Folk Dances

The Dances of the Cordillera Groups

- The ethnic dances in the Philippines are found in the different regions from the northern part to the southern part of the country. The Cordillera groups composed of the Bontocs, Ifugao, Benguet, Apayao, Kalinga, Itneg, Ilonggot, and Gaddang (BIBAKIIG) have their own unique customs and traditions reflected in their dances.
- Most of the dances are reflections of daily living.
- They used metal gongs called ganza and other percussive instruments to accompany their dances during rituals, festivities, and other social gatherings.

Example of Dances among the Cordillera Groups

Ethnolinguistic Group	Title of Dance	Dance Description
• Bontoc	1. Pattong 2. Balangbang 3. Takik/ Don-gadong 4. Palakis	➤ A war dance depicting a mock fight of two warriors. ➤ A victory dance performed after head hunting. ➤ A courtship and wedding dance. ➤ A courtship dance from Western Bontoc usually performed at wedding celebrations & during festivals like the canao & begnas.
• Ifugao	1. Talip 2. Intaneg 3. Bumayah 4. Monghimong 5. Western Influenced Dances

- When the Spaniards came to the Philippines in the 16th century, they brought with them the Spanish religion and European arts and culture. The

native religion and culture slowly gave way to Christianity and Western civilization. The natives started to lose most of their ancient traditions in the literary, visual, and performing arts. In no time, dances from Spain, France, and other European countries, such as the jota, balse, pandanggo, habanera, escotis, mazurka, paseo, marcha, and paso doble were adopted and adapted to the tastes and needs of a colonial society and the conditions of a tropical archipelago.

Examples of Dances with Western Influenced

Types of Dances	Title of Dance	Dance Description
• Quadrille Dances	1. Rigodon de Honor 2. Lanceros de Tayabas 3. Birginia 4. Pasakat 5. Los Bailes de Ayer or Maharlika 6. Lanceros de Lingayen 7. - **Biniganbigat** – courtship dance from Bangued, Abra portraying a story of a boy who is very much in love with a girl.

C. CHARACTERISTICS OF PHILIPPINE FOLK DANCES

1. As rule, dances begin and end with a saludo. A saludo is a three-step-turn in place and a bow to either partner or audience.
2. In general, dancers are far apart. A distance of about 6-8 feet from each other is normal.
3. There is very little, if any, body contact although holding hands is common.
4. Most of the dances are done in pairs. Hand movements play a very important role.
5. Most of our dances are done in long formation.
6. Our dances are performed by both young and old and by both sexes.

D. CLASSIFICATION OF PHILIPPINE FOLK DANCES

1. Geography

- 1.1 **National Dances** – These are the traditional dances throughout the

Philippines with a common basic movement or pattern but with light variation. Examples are: Carinosa, Kuratsa, Balitaw, Rigodon, Pandanggo, and Surtido.

- 1.2 **Local or Regional Dances** – these are dances found in certain localities or regions only. Examples are: Esperanza (Nabua, Camarines Sur), Alcampor (Leyte), Rogelia (La Union), Maglalatik (San Pablo, Quezon) and Biniganbigat (Abra).

2. Nature

- 2.1 **Occupational Dances** – depicting action of certain occupation, industry or human labor. Examples: Planting, Harvesting, Pounding, Winnowing, Pabirik, Mananguete, etc.

PART II – ANALYZING TEST ITEMS

Identify the dance terms and steps used in Philippine Folk dances.

Question No. 1 – Mr. Rioflorida instructed his students to do the kumintang.

What will be the correct movements execution of his students in doing the kumintang?

- The students will move their hand from the wrist in a clockwise or counterclockwise direction.
- The students will move their hand from the elbow in a clockwise or counterclockwise direction.
- The students will move their hand from the shoulder in a clockwise or counterclockwise direction.
- The students will move their hand from the upper extremities in a clockwise or counterclockwise direction.

The correct answer is option **A**. The correct movement of a Kumintang is moving the hand from the wrist in a clockwise or counterclockwise direction. Option B, C and D are all incorrect since movements from the elbow, shoulder, and upper extremities will not describe the correct movement for Kumintang.

Question No. 2 – The class of Mr. Cruz is dancing the Polkabal. One of the basic steps in the dance is the contraganza. If Mr. Cruz will demonstrate the step pattern of the dance step, which of the following will show the correct movement pattern?

- | | |
|----------------------------|---------------------------|
| A. Step, close, step | C. Slide, cut, cut |
| B. Cross-step, close, step | D. Leap, cross-step, step |

The correct answer is option **D**. Based on the book of Mrs. Francisca Aquino, "Fundamental Dance Steps and Music", the contraganza step is described as leap, cross-step, step. Option A is the correct dance step pattern for change step. Option B describes the dance step of cross change step. Option C is the step pattern for redoba step.

Question No. 3 – Which of the following is a dance step in 4/4 time music?

- | | |
|------------|------------|
| A. Espunti | C. Mudansa |
| B. Mazurka | D. Escotis |

The correct answer is option **D**. Among the dance steps mentioned in the choices Escotis is the only dance steps performed in 4/4 time music. Espunti, Mudansa, and Mazurka are dance steps performed in ¾ time music.

Question No. 4 – All of the following are correct except _____.

- | |
|------------------------------------|
| A. waltz – ¾ time signature |
| B. mazurka – ¾ time signature |
| C. polka – ¾ time signature |
| D. sway balance – ¾ time signature |

The correct answer is option **C**. The question is asking the one that is not appropriate in the given association. Option C is the only dance step that is not performed in ¾ time signature because it is a dance step commonly used in 2/4 time music. Option A, B and D are all dance steps in ¾ music.

Question No. 5 – It is a work-dance of Kalinga women where they carry baskets on their heads.

- | | |
|----------------|------------|
| A. Idudu | C. Bumayah |
| B. Ragragsakan | D. Bendian |

The correct answer is option **B**. Ragragsakan is a dance among Kalinga women that carries baskets or pots that are filled with goodies on their heads. The dance is also a festival dance among the Kalingas. Option A is incorrect because the dance Idudu is a dance among the Tinggians that shows the role of a father in making lullabies. Option C is not a Kalinga dance but an Ifugao festival dance. The dance is not an all-female dance. Option D is also incorrect because it is a dance from Benguet province. It is an all female dance but does not use baskets carried on their heads.

- Of the following patterns of movements, the one that best describes the mazurka step is _____.

A. slide, cut, hop	C. slide, slide, hop
B. hop, slide, close	D. hop, cut, and slide
- Which of the following associations is incorrect?

A. Cordillera dances of Luzon	C. Mangyan dances of Nueva Viscaya
B. Tausug dances of Mindanao	D. Ibanag dances of Cagayan
- Each of the following pairs of folk dance steps can be performed in combination except the _____.

A. waltz and reboda	C. waltz balance and paso español
B. polka and mazurka	D. cross waltz and step, swing, hop
- Which of the following dance steps has an incorrect time signature in 2/4 time music?

A. haplik	C. polka
B. contraganza	D. sagamantica
- All are four measures of music and beyond except _____.

A. double sway balance	C. haplik
B. mudansa	D. mazurka

11. Common among rural or countryside dances are the use of implements in their dance. They offer the glass of wine, a hanky, a hat, or even their own hands to somebody as a sign of invitation or love. This characterizes to a dance term which means _____.
A. salok B. sarok C. hapay D. bilao
12. Which of the following dance steps has eight measures?
A. bacui B. chotis C. haplik D. sagamantica
13. Masiwak is a common dance term among the _____.
A. Ilocano B. Ibanag C. Tagalog D. Visayan
14. Joseph is demonstrating the correct movement of hayon-hayon. Which of the following is the correct movement pattern that King June Four will show?
A. He will place his forearm in front and the other at the back of his waist.
B. He will cross his arms in front and open it to second position.
C. He will place both his arms at one side.
D. He will scoop his one arm up to fifth position.
15. Romeo is instructed by his PE teacher to do the habanera step. The step pattern that he will use is step, close, step, step and the counting to follow is _____.
A. 1 and 2 B. 1 2 C. 1 2 and D. 1 2 3
16. Kheeno is performing a sway balance with a waltz in his dance class. The counting that he will use when doing the sway balance with a waltz is _____.
A. 1, 2 3/1 2 3 C. 1, 2 3/1, 2 3
B. 1, 2 3/1 2, 3 D. 1, 2 3/1, 2, 3
17. Mr. Reyes asked his students to do a combination of the following dance steps; change, step, heel and toe change step, polka, heel and toe polka. He advises his students to get a folk dance music to accompany the combinations. What time signature the students will look for?
A. 2/4 time music C. 4/4 time music
B. 3/4 time music D. 6/8 time music
18. Which of the following is a Visayan dance term?
A. Bilao B. Jaleo C. Salok D. Sarok
19. Which is called the unit of formation?
A. cabaceras C. home position
B. costados D. set
20. Of the following folk dances, which has a combined rhythm?
A. Alitaptap C. Lancers de Negros
B. Tiklos D. Los Bailes de Ayer
21. Which of the following folk dances can be performed in 3/4 time music?
A. Cariñosa C. Polka sa Nayon
B. Tiklos D. Polka Antigo
22. What is the rhythm pattern of escotis?
A. uneven B. even C. broken D. syncopated
23. Which of the following is an occupational dance?
A. Polka sa Nayon C. Biniganbigat
B. Lancers de Negros D. Mananguete
24. You are instructing your class to do one sway balance with a waltz right and left alternately, two waltz steps right and left, and one waltz turn. How many measures are there in the combination?
A. 6 measures C. 12 measures
B. 8 measures D. 16 measures
25. Which dance is very popular in the Bicol Region that is commonly performed during wedding celebrations?
A. Kuratsa B. Pandango C. Sinakiki D. Pantomina

1. The waltz is done in what tempo?
A. slow
B. marching
C. moderate
D. fast
2. This is a kind of movement wherein the dancer glides one foot forcibly on the floor with or without transfer of weight. It is called _____.
A. step
B. tap
C. pivot
D. slide
3. Which type of dance is performed in social gathering to honor the guest?
A. Pantomina
B. Pandanggo
C. Papuri
D. Putritos
4. What is a Samal dance class of noble women which shows off women's dexterity and flexibility of the shoulders, elbows and wrist joints?
A. Sua-ko-Sua
B. Maglanka
C. Janngay
D. Kancingan
5. What is the national dance of the Philippines?
A. Singkil
B. Cariñosa
C. Rigodon
D. Tinikling
6. Which of the following dances use fighting implements?
A. Lancers
B. Sagayan
C. Rigodon
D. Pabo
7. A dance step of sixteen measures is _____.
A. haplik
B. sagamantica
C. papuri
D. mudansa
8. What is an Ibanag dance term wherein the dancers turn their hands from the

A. panadyak
B. masiwak
C. free hand
D. kumintang

- 306 PNU LET Reviewer

15. It is a dance among the Apayaos imitating the high – flying bird and is called _____.

- | | |
|------------|--------------|
| A. Bendian | C. Say - yam |
| B. Pattong | D. Turayen |

16. Who are called “Peacocks of the mountain”?

- | | |
|-------------|-------------|
| A. Bontocs | C. Kalingas |
| B. Benguets | D. Apayaos |

17. Which is a dance among the Maranaos which displays the women’s simplicity and elegant walk with the use of beautifully decorated umbrellas?

- | | |
|---------------|---------------|
| A. Sagayan | C. Pag-aper |
| B. Kapamalong | D. Kakulangan |

18. This is Palawan’s famous ceremonial rite of healing the sick, imploring and thanksgiving for a good and bountiful harvest. Its name is _____.

- | | |
|----------------|-------------|
| A. Pagdidiwata | C. Binaylan |
| B. Blit-Blaan | D. Sohten |

19. Which of the following folk dances are classified as ceremonial dances?

1. Dugso
2. Putong
3. Pandang-Pandang
4. Daling-Daling

- | | |
|------------|-----------|
| A. 1 and 2 | C. 3 only |
| B. 3 and 4 | D. 4 only |

20. The National Artist in dance who is also known as the Mother of Folk Dance is _____.

- | | |
|--------------------|---------------------------|
| A. Lucrecia Urtula | C. Leonor Orosa Goquingco |
| B. Corazon Inigo | D. Francisca Reyes Aquino |

21. Which steps have the same time signature?

- A. polka and redoba
- B. change step and waltz balance
- C. kuradang and contraganza
- D. espunti and sangig

Read the paragraph below and answer the questions that follow.

You are teaching a unit of folk dance to your first year students. They will be learning the dance Subli. Answer the following questions that will help your class understand thoroughly the nature and characteristics of the dance.

22. What is the sociological context of the dance?

- A. Subli is a festival dance from Quezon.
- B. The dance comes from two tagalog words “sumubsob” at “bumali”.
- C. It is a dance in honor of the Mahal na Poong Sta. Krus.
- D. The dance showcases the use of bamboo sticks.

23. What is the correct time signature of the music used in the dance?

- | | |
|-----------------------|-----------------------|
| A. 2/2 time signature | C. ¾ time signature |
| B. 2/4 time signature | D. 4/4 time signature |

24. Which of the following steps are common to the dance?

- | | |
|----------------|------------------|
| A. Change step | C. Mincing steps |
| B. Mazurka | D. Polka steps |

25. What are the basic arm movements used in the dance?

- | | |
|--------------------------|-----------------------------|
| A. Bilao and Hayon-hayon | C. Hapay and Salok |
| B. Sarok and Kewet | D. Masiwak and Forearm turn |

PART I - CONTENT UPDATE

Research in MAPEH

Prepared by:
Dr. Larry A. Gabao

Competencies:

1. Determine appropriate research methods for Music, Arts, Physical Education and Health.
2. Define and Review the various types of research in MAPEH.
3. Apply theories and principles in conducting MAPEH Research.

Definition of Terms

Applied Research	Type of research that has direct value to practitioners but in which the researcher has limited control over research setting.
Basic Research	Type of research that may have limited direct application but in which the researcher has careful control of the situation.
Biomechanics	The application of the physical laws of motion to the study of biological systems.
Case Study	Form of descriptive research in which a single case is studied in depth to reach a greater understanding about other similar cases.
Categorical Response	Type of closed question that offers the subject only two responses such as “yes” or “no.”
Categorical Variable	A kind of independent variable that cannot be manipulated because it is categorized by age, race, sex, and soon; also called moderator variable.
Central Tendenc	A single score that best represents all score.
Closed Question	Category of question found in the questionnaires or inter views that requires a specific response and that often takes the form of rankings, scaled items

Content Validity	Condition that is claimed (usually in educational settings) when a test adequately samples what was covered in the course.	Historical Research	Type of research that deals with events that have already occurred
Cross-sectional Study	Methods of research in which samples of subjects from different age groups are selected in order to assess the effects of maturation.	Hypothesis	The anticipated outcome of the study or experiment.
Cross Validation	Technique to assess the accuracy of a prediction formula in which the formula is applied to a sample not used when the formula was developed.	Independent Variable	The part of the experiment that the researcher is manipulating; also called the experimental or treatment variable.
Dependent variable	The effect of the independent variable; also called the yield.	Internal Reliability	The extent of agreement among different observers concerning the description of events.
Descriptive Research	Type of research concerned with status, including techniques such as surveys, case studies, and developmental research.	Internal Validity	The extent to which the results of a study can be attributed to the treatments used in the study.
Developmental Research	Study of changes in behavior across the life span.	Likert Scale	Type of closed question that requires the subject to respond by choosing one of five scaled items with the assumption that there are equal intervals between items.
Empirical	Describes data or a study that is based on objective observations.	Mean	A statistical measure of central tendency that is the average score of the group.
External Reliability	The content of the data in qualitative research that determines the degree to which a study can be repeated.	Median	A statistical measure of central tendency describing the middle score in a group.
Experimental Research	Type of research that involves the manipulation of treatments in an attempt to establish cause-effect relationships.	Mode	A statistical measure of tendency that is the most frequently occurring
External Validity	The generalizability of the results of the study.	Normal Curve	Distribution of data in which the mean, median and mode are the same point (center of distribution) and ± 1 s from the median includes 68% of the scores, ± 2 s from the mean, includes 95% of the scores, and ± 3 s includes 99% of the scores.
		Normative Survey	Survey method that involves establishing norms for abilities, performances, beliefs and attitudes.

Null Hypothesis	Hypothesis that is primarily used in the statistical test for the reliability of the results that says that there are no differences among treatments (or no relationship among variables).
Paradigm	A scientific model and the approaches used to test the model; also called perspective, tradition, and approach in historical research.
Probability	The odds that a certain event will occur.
Qualitative Research	Research method that involves intensive, long-time observation in a natural setting; precise and detailed recording of what happens in the setting; interpretation and analysis of the data using description, narratives, quotes, and charts and tables. Can also be called ethnographic, naturalistic, interpretive,, grounded, phenomenological, subjective, and participant observational.
Questionnaire	Type of paper and pencil survey used in descriptive research in which information is obtained by asking subjects to respond to questions rather than by observing their behavior.
Reliability	The consistency and dependability of a measure.
Research Proposal	A formal preparation that includes the introduction, review of literature, and proposed method for conducting the study.
Standard Deviation	An estimate of the variability of the scores of a group around the mean.
Triangulation	Term borrowed from the field of surveying that refers to

the use of more than one source of data to substantiate a researcher's conclusion.

Validity

The degree of difference between each individual score and the central tendency.

The Nature of Research

The word "research" may mean several understanding depending on the people's background, purpose, and usage. This particular explanation will deal more on the educational aspect of research whereby it means careful and systematic procedure to solve some problems and objectives.

Characteristics of research:

- **Systematic** – Problem solving is accomplished through the identification and labeling variables and is followed by the design of research that tests the relationships among these variables. Data are then collected that, when related to the variables, allow for the evaluation of the problem and hypothesis.
- **Logical** – Examination of the procedures used in the research process allows researchers to evaluate the conclusions that are drawn.
- **Empirical** – The researcher collects data on which to base decisions.
- **Reductive** – Research takes many individual events (data) and uses them to establish more general relationships.
- **Replicable** – The research process is recorded, enabling others to test the findings by repeating the research on previous results.

Applied and Basic Research

Applied Research – Tends to address immediate problems, to use so-called real-world settings, to use human subjects, and to use limited control over the research setting but to give results that are of direct value to practitioners.

Basic Research – Usually deals with theoretical problems, has the laboratory as the setting, may frequently use animals as subjects, has carefully controlled conditions, and procedures results that have limited direct application.

Quality Research – Always involve some or all of the following components

- Identification and delimitation of a problem
- Searching, reviewing and effectively writing about relevant literature
- Specifying and defining testable hypotheses
- Designing the research to test the hypotheses
- Selecting, describing, testing and treating the subjects
- Analyzing and reporting the results
- Discussing the meaning and implications of the findings.

Unscientific vs Scientific Methods of Problem Solving

Humans Self Method of Solving Problems

- a. **Tenacity** – changing to certain beliefs regardless of the lack of supporting evidence.
 - e.g. Unlucky day seeing a BLACK cat
 - Wearing a lucky dress, cap, hat, shoes, etc.
- b. **Intuition** – or sometimes considered common sense.
 - e.g. Winning a raffle, passing exams
- c. **Authority** – reference to some authority as source of knowledge or totally dependent on what authority is saying without verified results or knowledge such.
- d. **Rationalistic Method** – rationalizing knowledge
 - e.g. All basketball players are tall.
 - Tom Thumb is a basketball player.
 - Therefore Tom Thumb is tall
 - (In this case, Tom Thumb happens to be a dwarf)
- e. **Empirical Method** –the word empirical denotes experience and the gather-

ring of data. This is more guided with observations and experience rather than theory. These are pitfalls regarding experience because it is limited.

The Scientific Method of Problem Solving

Basic steps in Scientific Method

- Step 1. Developing the Problem (Defining and Delimiting)
Designing and executing a selected topic with sound investigation and careful study.
- Step 2. Formatting the Hypotheses
Expected results or anticipated solution based on some theoretical construct or results of previous studies.
- Step 3. Gathering the Data
Method of acquiring the necessary data must be thoroughly discussed, the reliability of measuring instruments, the controls that should be employed, and the objectivity of the data gathering process. Internal and external validity are related to the research design.
Internal validity refers to the extent to which results can be attributed to the treatments used in the study.
External validity pertains to the generality of the results.
- Step 4. Analyzing and Interpreting Results
Analysis and interpretation of results provided by evidences to support the research synthesizing the data to contribute to the development of a theory.

Types of Research

1. Analytical Research

Involves in-depth study and evaluation of available information in an attempt to

explain complex phenomena. The different types of analytical research are:

- **Historical Research**
Deals with events, organizations, institutions and people that have already occurred. Locating pertinent sources of information (primary or secondary) concerning the specific problem.
- **Philosophic Research**
Critical inquiry. The researcher establishes a hypothesis, examines and analyzes existing facts and evidences into a workable theoretical model.
- **Literature Review**
Paper reviews involves analysis, evaluation, and integration of published literature after leading to a conclusion.
- **Meta-Analysis**
Analyzing the findings from numerous studies.

2. **Descriptive Research**

Primarily concerned with status. Most prevalent is the use of questionnaires. Other forms include:

- **Questionnaires**

The questionnaire usually strives to secure information about present practices, conditions, and demographic data. Occasionally, a questionnaire asks for opinion or knowledge.

The researcher must take great care in preparing the questionnaire to obtain valid and reliable responses. However, the questionnaire has acquired an unfavorable reputation as research tool in some fields. This has been the result of poorly designed and overused questionnaires.

- **Interview**

The interview and the questionnaire are essentially the same technique in so far as their planning and procedures are concerned. Obviously, the interview has certain advantages over the questionnaire in that the re-

searcher can rephrase questions and ask additional ones to clarify responses and secure more vivid results. Becoming a skilled interviewer requires training and experience. Telephone interviewing has become increasingly more common in recent years, mainly because of cost. Telephone interviews costs half as much as face-to-face interviews and has the additional advantage of being able to cover a wide geographical area, which is generally a limitation in personal interviews.

- **Normative Study**

The normative study generally seeks to gather performance or knowledge data on a large sample from a population and to present the results in the form of comparative standards or norms.

- **Case Study**

The case study is used to provide detailed information about an individual (or institution, community etc.) the case study aims to determine unique characteristics about the subject or condition. This descriptive research technique is used widely in fields such as medicine, psychology, counseling, and sociology. The case study is also a technique used in qualitative research.

The researcher attempts to gather and analyze as much information about the case as possible. Sometimes, subjects who are high achievers are studied, and often the lower performer serves as the subject.

- **Job Analysis**

The objective of the job analysis is to describe in details the various duties, procedures, responsibilities, preparation, advantages, and disadvantages of a particular job. Used widely in vocational training and counseling, the job analysis research procedures require time, attention to details, and a variety of data-gathering techniques. The job analysis has not been used to a great extent in health and physical education, recreation and dance, but some studies dealing with the duties of athletic director, intramural

director, and physical education teacher have been conducted.

- **Documentary Analysis**

The documentary analysis could be classified under analytical research because it is used in literature reviews, historical studies, and other areas. However, the form of documentary analysis included in descriptive research is directed primarily at establishing the status of certain practices; areas of interest; and the prevalence of certain errors, usage of terms, and space counts. For example news papers or magazines might be studied to determine the extent of coverage (and thus public interest) devoted to certain sports or recreational activities. A study to ascertain the frequency of use of various statistical procedures in a research journal also falls under the category of documentary analysis.

- **Developmental Studies**

In developmental research, the investigator is usually concerned with the interaction of learning or performance with maturation. For example, a researcher may wish to assess the extent to which the ability to process information can be attributed to maturation as opposed to strategy, or the researcher may desire to determine the effects of growth on a physical parameter such as aerobic capacity.

Developmental research can be undertaken by what is called the longitudinal method, whereby the same subjects are studied over a period of years. Obvious logistical problems are associated with longitudinal studies, so an alternative is to select samples of subjects from different age-groups to assess the effects of maturation. This is called the cross-sectional approach.

- **Correlational Studies**

The purposes of the correlational study is to examine the relationship between certain performance variables, such as heart rate and ratings of perceived exertion; the relationship between traits such as anxiety and pain

tolerance; or the correlation between attitudes and behavior, as in the attitude toward fitness activities.

Sometimes correlation is employed to predict performance. For example, a researcher may wish to predict body fat percentage from skin fold measurements. First, the correlation between percent body fat (as measured) by a method such as underwater weighing) and skinfold measurements is established with a sample of subjects. Percent fat can then be predicted for other subjects on the basis of this relationship simply by using skinfold measurements. Correlational research is descriptive in that you cannot presume a cause-and-effect relationship. All that can be established is that there is an association between two or more traits or performances.

3. Experimental Research

Experimental research is usually acknowledged as being the most scientific of all the types of research because the researcher can manipulate treatments to cause things to happen. (i.e., a cause-and-effect situation can be established). This is in contrast to other types of research in which already existing phenomena or data from the past are observed and analyzed. For an example of an experimental study, assume the Virginia Reel, a dance teacher, hypothesizes that students would learn more effectively through the use of a videotape. First, she randomly assigns students to two sections. One section is taught by the traditional method (explanation, demonstration, practice and critique). The other section is taught in similar manner, except the students are filmed while practicing and can thus observe themselves at the same time the teacher critiques their performances. After 9 weeks, a panel of dance teachers evaluates both sections. In this study, method of teaching is the independent variable and dance performance (skill) is the dependent variable. After the groups' scores are compared statistically, Virginia can conclude whether her hypothesis can be supported or refuted.

In experimental research, the researcher attempts to control all factors except the experimental (or treatment) variable. If the extraneous factors can be successfully controlled, then the researcher can presume that the changes in the dependent variable can presume that the changes in the dependent variable are due to the independent variable.

Several research designs are used in experimental research. Not all designs are truly experimental in that the independent variable cannot always be manipulated. In a study of learning strategies of brain-damaged and normal children, the researcher certainly would not take a sample of children and cause half of them to become brain damaged; instead children with brain damage would be chosen for the study. Similarly, a researcher wishing to compare training responses of men and women would select subjects from each sex and then compare their responses. Thus when there are preexisting differences such as sex, race, age, and personality traits, the independent variable is not truly independent but categorical. Such design is an example of quasi-experimental design.

4. Qualitative Research

In physical education, exercise science, and sport science, qualitative research is so called the new kid on the block. Actually, qualitative research has been used for many years in other fields, such as anthropology and sociology. Researches in education have been engaged in qualitative methods longer than researches in our fields. As previously mentioned, several names are given to this research (ethnographic, naturalistic, interpretative, grounded, phenomenological, subjective and participant observational). Some of these are simply name differences, whereas some have different approaches and points of focus. We have arbitrarily lumped them all under the heading of qualitative research as that seems to be the most common term used in our field.

It is important to note that the term “qualitative” infers interpretative, as opposed to simple, description. Description is a technique as such does not

constitute a research method. The term “ethnography” has been closely associated with anthropology, although it has been adapted by educational researchers. The term refers to the process of re-creating for the reader the shared beliefs, practices, and behaviors of some group of people. Participant observation refers to the extent which the researcher is actually involved in the group that is being studied. Thus, the role of the observer can range from an observer who has almost no involvement in the activity to a complete participant who is totally involved in the activity. The degree of involvement is determined by type of information designed and sometimes by how much involvement is permitted. The case study was mentioned in the section on descriptive research. It is also an important technique in qualitative research. It is used for diagnosing problems; for evaluating programs, practices, and policies; and for developing insights into the behavior of individuals and groups.

The **basic characteristics of qualitative research** include the following:

- Intensive, longtime observation and participation in natural a setting.
- Precise and detailed recording of what happens in the setting through the use of field notes, audiotapes, videotapes, and other kind of documentary evidence.
- Interpretation and analysis of the data through the use of rich description, interpretative narratives, direct quotes, charts and tables, and sometimes statistics (usually descriptive)

The nature of the data and analysis sometimes leads to questions different than those formulated at the beginning of the study if they more accurately capture the participants' perspectives that the original focus questions.

Qualitative research is different from other research methods. It is a systematic method of inquiry, and it follows a scientific method of problem solving to a considerable degree; however, it deviates in certain dimensions. Qualitative research rarely establishes hypotheses at the beginning of the study. It proceeds

in an inductive process in developing hypotheses and theory as the data unfolds. Theory is grounded in the data. The researcher is the primary instrument in the data collection and analysis. Qualitative research is characterized by intensive firsthand presence. The tools of data of collection are observation, interviews and researcher-designed instruments.

The narrative vignette is a fundamental component of the qualitative report. Detailed description of an event, a class, a game, a workout, or a physical setting are presented, including what people say, do, think, and feel in that setting. The goal is to richly and accurately portray the experiences and perceptions of the participants. The vignette captures the readers' attention and helps give the reader a sense of being there. The participants' own words are used as much as possible. The data are primarily verbal as opposed to the numerical data in quantitative types of research.

The qualitative researcher is interested with the process rather than the product. The basic question, what is going on here? guides the researcher's efforts. The research is done in the natural setting. The term fieldwork borrowed from anthropology, is used in describing methodology. Data analysis is begun as soon as the data collection is begun rather than at the end, as in quantitative research. The researcher sorts and categorizes the data, formulates hypotheses to explain the data, and makes interpretive connections between narrative vignettes and other forms of description. The interpretations of the analysis of data are confirmed through triangulation, which means cross-checking through other sources of data, other methodologies, other researchers, and other theories. Qualitative research is becoming increasingly popular and will undoubtedly continue to do so. It is not an easy type of research, as it takes a great deal of time, effort, and analytical skill. Qualitative research offers an interesting and valuable alternative approach to solving problems in our field.

Chapter 1: Introduction

Here the problem is defined and delimited. The researcher specifically identifies the problem and states the research hypotheses. Certain terms critical to the study are operationally defined for the reader, and limitations and perhaps some basic assumptions are acknowledged. The review of related literature may be in the first chapter or may warrant a separate chapter. When it is in the first chapter, it more closely adheres to the steps in the scientific method of problem solving; that is, the literature review is instrumental in the formulation of hypotheses and the deductive reasoning leading to the statement of the problem.

Chapter 2: Review of Related Literature

Chapter 3: Method

Often, this chapter is the review of literature as, for example, in this text. However, because the purpose here is to make the thesis format parallel to the data-gathering steps, this chapter relates to the scientific method. First, the researcher explains how the data were gathered. The subjects are identified, the measuring instruments are described, the measurement and treatment procedures are presented, the experimental design is explained, and the methods of analyzing the data are summarized. The major purpose of the method chapter is to describe the study in such detail and with such clarity that you could duplicate it.

The first two chapters often comprise the research proposal and are presented to the student's thesis committee prior to the research being undertaken. When this occurs, these two chapters should be written in future tense, then changed to past tense when the final version of the thesis is completed.

Chapter 4: Results

The results chapter presents the pertinent findings from the analysis of data. It corresponds to the step in the scientific method in which the results are scrutinized as to their meaningfulness and reliability.

Chapter 5: Discussion and Conclusions

In this last step in the scientific method, the researcher employs effort to analyze the findings, to compare these findings with previous studies and to integrate them into a theoretical model. In this chapter, the research hypotheses are judged as to their acceptability. Then, on the basis of the analysis and discussion, conclusions are usually made. The conclusions should address the purpose and the sub purposes that were specified in the first chapter.

PART II – ANALYZING TEST ITEMS*For Competency Number 1:*

Determine appropriate research methods for Music, Arts, Physical Education and Health.

1. Enrico Rosales wanted to discover the origins of a sport way back the time of Modern Olympics in 1896. What type of research method will Mr. Rosales use?
 - A. Normative Study
 - B. Analytic Study
 - C. Philosophic Research
 - D. Historical Research
2. In the selection of subjects in a problem of who plays the violin better between male or female, the subjects' characteristics are extremely pertinent. What method can be best utilized to select the subjects?
 - A. Random sampling
 - B. Fish-bowl sample
 - C. Draw lots sampling
 - D. Purposive sampling
3. Which is research subjects rights must be considered in the following? Identification number is used rather than the name.
 - A. Right to remain anonymous
 - B. Right to privacy and nonparticipation
 - C. Right to confidentiality
 - D. Right to human dignity
4. The researcher does not ask unnecessary information and should even ask consent from parents.
 - A. Right to remain anonymous
 - B. Right to privacy and nonparticipation
 - C. Right to confidentiality
 - D. Right to human dignity
5. The researcher's questioning is well meaning and sensitive to the person or subject.
 - A. The right to remain anonymous
 - B. The right to privacy and nonparticipation
 - C. The right to confidentiality
 - D. The right to human dignity
6. The researcher has to tell honestly the subjects of his intention not to divulge identities and data.
 - A. The right to privacy and nonparticipation
 - B. The right to remain anonymous
 - C. The right to confidentiality
 - D. The right to human dignity
7. In the conduct of experiments using the different meaning instruments in measuring sports skills, attitude, & habit, the researcher bears the following: To generate accurate information in a sport psychology study regarding the influence of steroid usage which test is more appropriately selected.
 - A. Steroid Knowledge Test
 - B. Responsible Drug Test
 - C. Personality Trait Measure Test
 - D. All of the above
8. Motor behavior is conducted to test the subjects.
 - A. Reaction and Movement Time
 - B. Reaction Time
 - C. Movement Time
 - D. Measured Time
9. Vincent is conducting a research to find out the cause and effect of his newly developed exercise routine.

- What type of research will he use?
- A. Correlational Studies C. Development Studies
B. Experimenting Research D. Documentary Analysis
10. In the descriptive type of research, what is the most commonly utilized instrument to obtain factual data?
- A. Survey C. Interview
B. Questionnaire D. Essay
11. The artifacts found in the Mangyan culture are well described in their artworks inscribed in wood and bamboo carvings. Which type of research study can be used to validate the information?
- A. Experimental Research C. Historical Research
B. Quantitative Research D. Qualitative Research
12. Triangulation of data is appropriately utilized in
- A. Experimental Research C. Historical Research
B. Quantitative Research D. Qualitative Research
13. The best technique employed in a survey using a series of questionnaires in order for the subjects to arrive to a decision is
- A. Open-ended Survey C. Nero-Interview Method
B. Delphi Survey Method D. Normative Survey
14. In experimental research the type of questioning is applied. Which type of questions is best used for the following question: What it would be like in my first day of teaching?
- A. Ideal Question C. Interpretive Question
B. Hypothetical Question D. Subjective Question
15. What it would be like if I handle the best or least section of grade six pupils?
- A. Ideal C. Interpretive
B. Hypothesis D. Subjective
16. What it would be like if I make my students feel comfortable and happy?
- A. Hypothetical C. Interpretive
B. Ideal D. Subjective
17. In the descriptive type of research several observations are made. There are commonly used procedures for recording observational data. Which type of observation recording can be utilized in the difficulty of counting movement occurrences?
- A. Narrative or continual recording C. Interval Method
B. Tallying or frequency counting D. Duration Method
18. The recording is done in a series of occurrences on movement happening.
- A. Narrative or continual recording C. Interval Method
B. Tallying or frequency counting D. Duration Method
19. The recording is done each time the movement occurs
- A. Narrative or continual recording C. Interval Method
B. Tallying or frequency counting D. Duration Method
20. The recording is done in a time device on how much time a movement occurs.
- A. Narrative or continual recording C. Interval Method
B. Tallying or frequency counting D. Duration Method
21. Research characterizes scientific search for result or findings. In order to protect the study one material must possess a characteristic which is valid. What kind of technique will one utilize on this principle?
- A. Cross Validation C. External Validation
B. Internal Validation D. All of the above
22. Historical Research involves different types of research methods for accuracy of reporting. Which of the following best describe the type of historical

report? A good map locates roads and landmarks including the time, place, and person involved. What type of historical report is applied?

- A. Analytic Historical Report
- B. Descriptive Historical Report
- C. Experimental Historical Report
- D. Methodological Historical Report

23. To compare the Inter-collegiate intramurals in 2005 at the Philippine Normal University and today what type of historical report can be used?

- A. Analytic Historical Report
- B. Descriptive Historical Report
- C. Experimental Historical Report
- D. Methodological Historical Report

24. Writing the research report is both prepared in a scientific procedure. The written report follows an appropriate format and the oral report or defense is well patterned. When preparing for a oral defense which is a more attractive presentation via PowerPoint presentation of numerical data?

- A. Graphical Presentation
- B. Word Text Presentation
- C. Puzzle Type Presentation
- D. Audio-Visual Presentation

25. In a big conference or meetings of sycholars which has the most usable method of research presentations?

- A. Oral Presentation
- B. Poster Presentation
- C. Plenary Presentation
- D. Group Presentation

PART III – ENHANCING TEST TAKING SKILLS

1. One characteristic of strong research follows an examination of the procedures which allows the researcher to evaluate the necessary conclusion. This characteristic pertains to what principle?
 - A. Systematic
 - B. Logical
 - C. Empirical
 - D. Replicable
2. There are Humans self method are sometimes attempted to influence research findings. Which of the following options dictate doubts of reliability using common sense?
 - A. Authority type of solving problem
 - B. Intuition
 - C. Empirical
 - D. Rationalistic
3. In developing a problem, one basic requirement is to clearly spell out what the intention is all about. Which option below can be applied?
 - A. Formulating Hypothesis
 - B. Gathering Data
 - C. Analyzing Result
 - D. Defining and Delimiting
4. Jun Posadas is a political celebrity in the ZTE Deal scandal. To find out more of the details of this person, one can apply which type of research?
 - A. Correlational Studies
 - B. Case Study
 - C. Developmental Study
 - D. Interview
5. Music and dance of the ethnic groups vary in many aspects of interpretations on how they were gathered. To protect the integrity of the ethnic group, one should utilize what type of research?
 - A. Qualitative Research
 - B. Quantitative Research
 - C. Experimental Research
 - D. Analytical Research

6. A hypothesis is established prior to the conduct of actual research. This is done to test the reliability of the result that says there are no differences on relationship among variables. Which of the following is appropriately used?
- A. The hypothesis is true and valid
 - B. The hypotheses is null and valid
 - C. The hypothesis is null
 - D. The hypotheses is not true and valid
7. When two variables are measured on their degree of association a simple correlation is used known as
- A. Pearson r
 - B. T – test
 - C. Z - test
 - D. Central Tendency
8. A Statistical computation is used whether the independent variable (weight training vs. regular activity) produces a change in the dependent variable (standing long jump score). The test to be used is
- A. Pearson r
 - B. Z – test
 - C. Central Tendency
 - D. T – test
9. To select subjects to represent a larger population is known as:
- A. Sampling
 - B. Random Sampling
 - C. Subject Sampling
 - D. Sample Sampling
10. A concept that deals with certain things to happen is called.
- A. Frequency
 - B. Equally likely event
 - C. Tendency
 - D. Probability
11. When a researcher wants to determine the average of two or more correlation he will use a tool called
- A. Z – test
 - B. T – test
 - C. Correlation Test
 - D. Prediction test
12. The degree to which a test or instrument measures what it intends to measure is known as
- A. Reliability
 - B. Validity
 - C. Stability
 - D. Probability
13. In measuring physical fitness, the most valid test for cardio-vascular fitness is called
- A. Step test
 - B. Flex-Arm Hang
 - C. VO2 Max
 - D. Distance Run
14. Skinfold thickness with the use of calipers or the accuracy of predicting percent of fat is an anthropometric measure also known as
- A. Density
 - B. Density Volume
 - C. Body Composition
 - D. Body Fat
15. Which of the following is an open-ended question?
- A. How do you like your job?
 - B. What is your job?
 - C. Where do you work?
 - D. What is your work?
16. Which part of the process is developing the problem of the study relates the bulk of reviews and attempting compare similarities and differences?
- A. Identifying the problem
 - B. Developing Hypothesis
 - C. Review of related literature
 - D. Background of the study
17. A study on teacher pedagogical skills to handle the piano lessons are capable in terms of knowledge and skills. What type of research activity is being considered?
- A. Basic assumptions and limitations
 - B. Basic and applied research
 - C. Basic Procedure
 - D. Basic Understanding

18. The most common tool for research in striving to secure information about practices, conditions, and demographic data is called:
- A. Questionnaire
 - B. Interview
 - C. Documentary Analysis
 - D. Background of the study
19. The subjects of the study or respondents must feel secured and can trust the researcher. Which of this type of character is a requirement?
- A. Kind and Cheerful
 - B. Trustworthy and honest
 - C. Cooperative and Hardworking
 - D. Joyful and smart
20. Which of the process is applicable to value the new works of research?
- A. Public Bidding
 - B. Pilot Testing
 - C. Public Broadcasting
 - D. Investigating

Scales of measurement are established to determine the validity and reliability of results. Which of the following are appropriately used?

21. When scores are grouped into categories or classes like gender and race:
- A. Ordinal Scale
 - B. Normal Scale
 - C. Interval Scale
 - D. Ratio
22. It provides more information or data that determine the highest to lowest.
- A. Interval Scale
 - B. Ratio
 - C. Nominal
 - D. Ordinal
23. Scores are interpreted to find out the difference of in-between scores.
- A. Ratio
 - B. Interval Scale
 - C. Nominal Scale
 - D. Ordinal Scale
24. A way to measure force, time, and distance with true zero points is called
- A. Ratio
 - B. Interval
 - C. Nominal
 - D. Ordinal

25. Terms used in the study may come in different interpretations. If terms are observational and on actual usage, the definitions may be called as
- A. Preferable Term
 - B. Conditional Term
 - C. Operational Terms
 - D. Dictionary Terms
